

# Techniques for Carotid Intervention

Jay S. Yadav MD

Cleveland, Ohio

TCT 2006

# Disclosures

---

- ◆ **Inventor of Angioguard; fixed and recurring payments from JNJ**
- ◆ **Advisor: JNJ, Guidant**

# Understand the Patient

---

- ◆ **What is the Cause of the Patient's Sxs?**
- ◆ **What is there baseline neurological status?**

**Neurological Hx and Exam**

**Head CT or MRI**

**Carotid US**

# Anti-Platelet and anti-thrombotic

---

## ◆ Pre-Procedural:

- ASA 325 mg/d
- Clopidrogel: 1 week pre
  - » 450 mg at least 4 hrs pre-procedure

## ◆ Intra-Procedural:

- Heparin: 75 u/kg
- AngioMax: less data

## ◆ Post-Procedural:

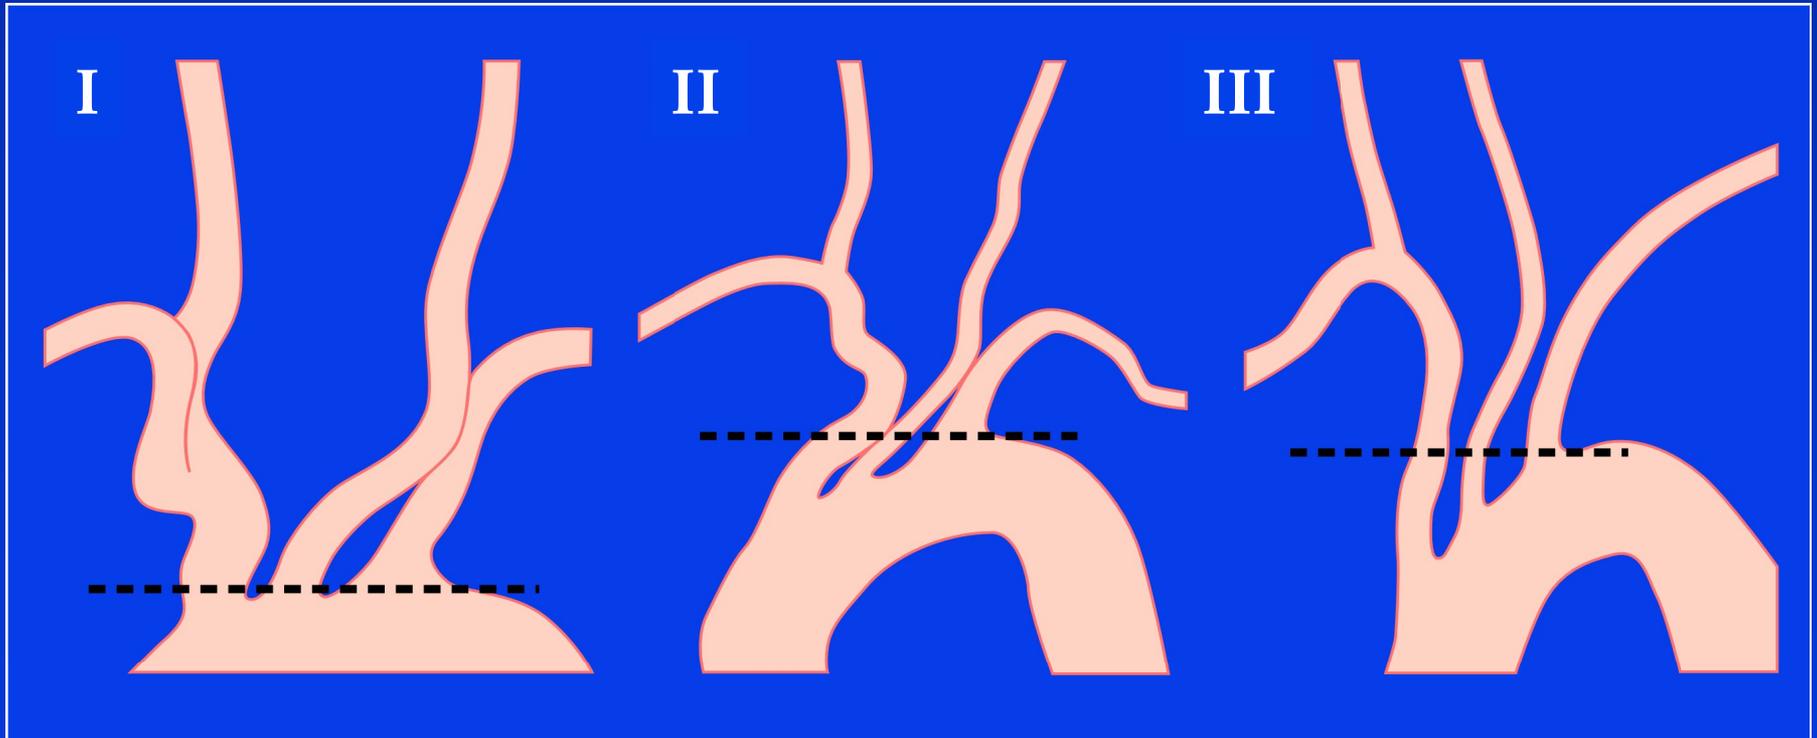

- Clopidrogel: 75 mg/d for 3 to 4 weeks
- ASA 325 mg/d

# Immediate need for major surgery

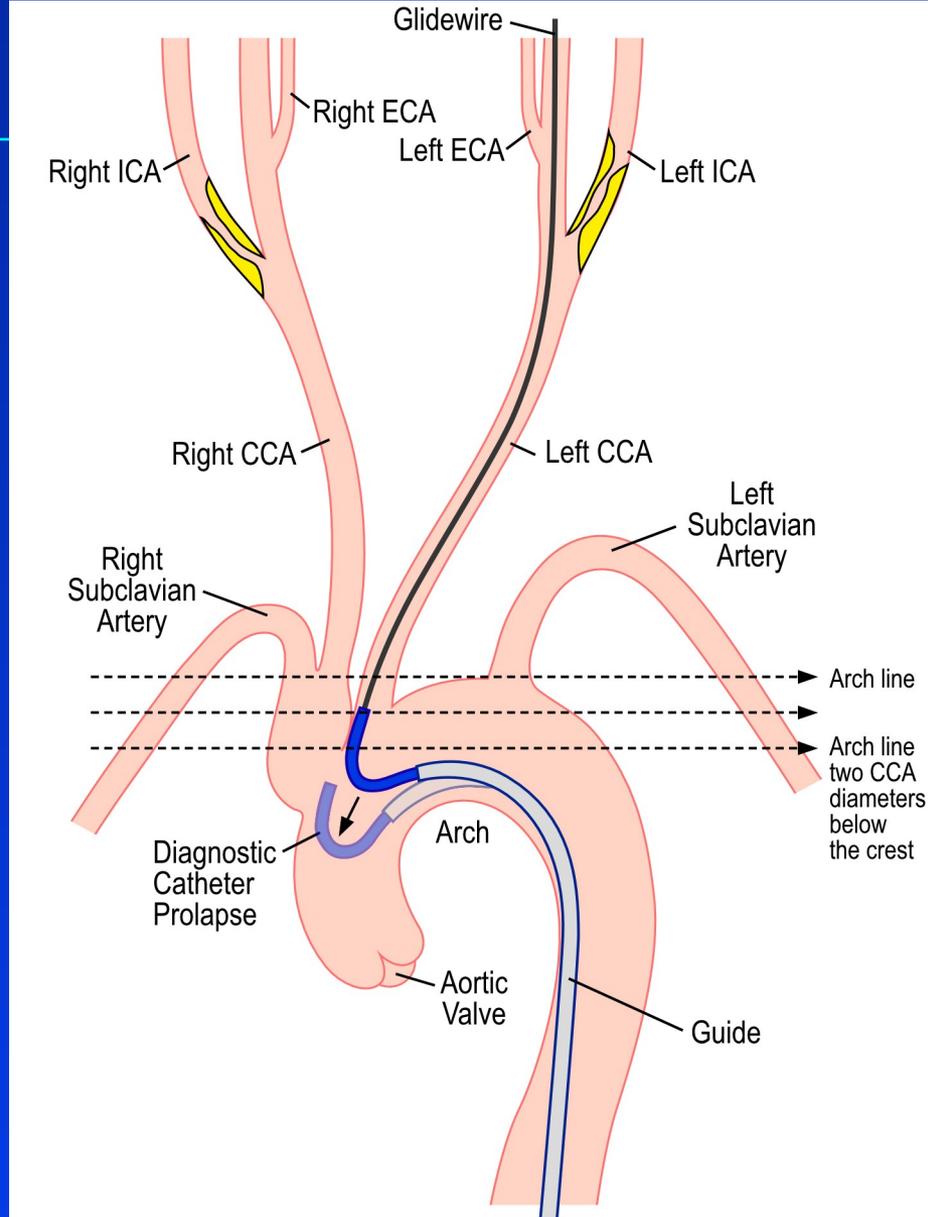

---

- ◆ PTA Only
- ◆ ASA
- ◆ US 6 weeks later and Stent if needed

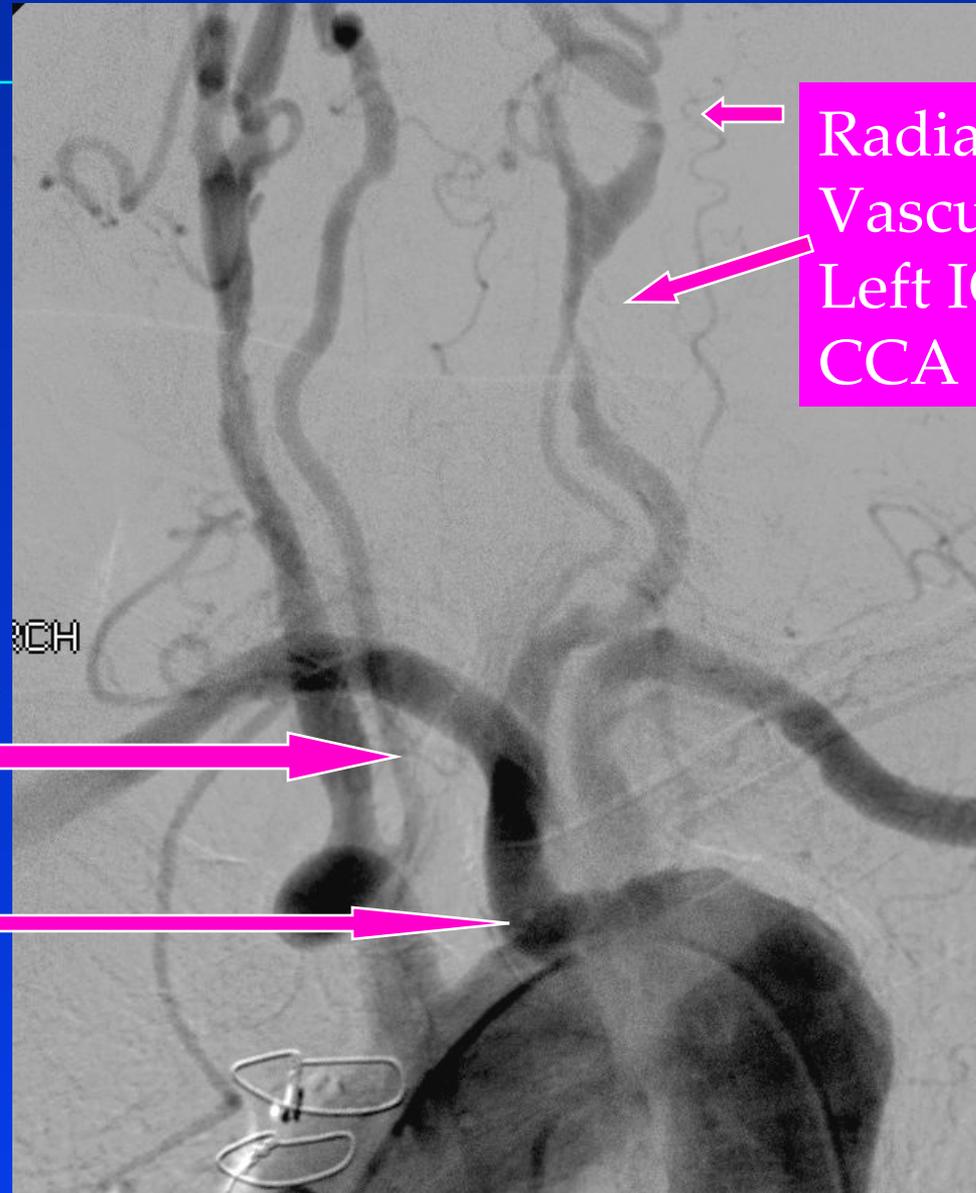

# Aortic Arch Classification

# Diagnostic Catheter Prolapse

# Anomalous Origin of the Right Subclavian from the Left Side of the Aortic Arch

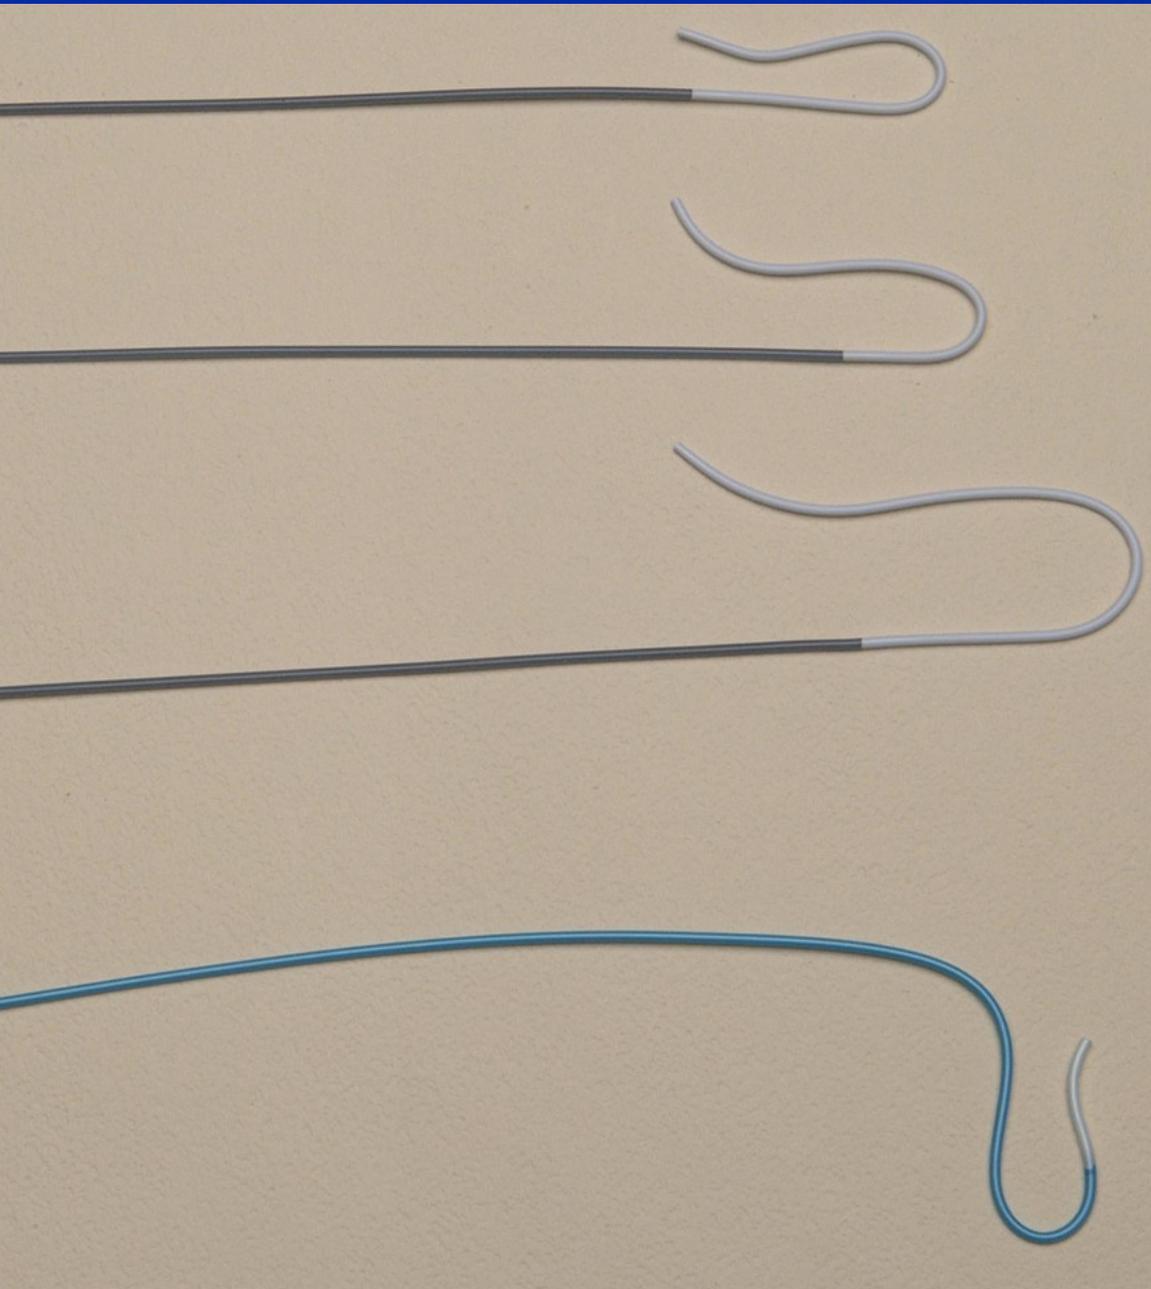

Radiation  
Vasculopathy In  
Left ICA and  
CCA

R Vertebral originates  
From Innominate  
Artery

R Subclavian

# Diagnostic Cerebral Angiography Catheters

**SIMMONS 1**

**SIMMONS 1 1/2**

**SIMMONS 2**

**HN2 / VITEK**

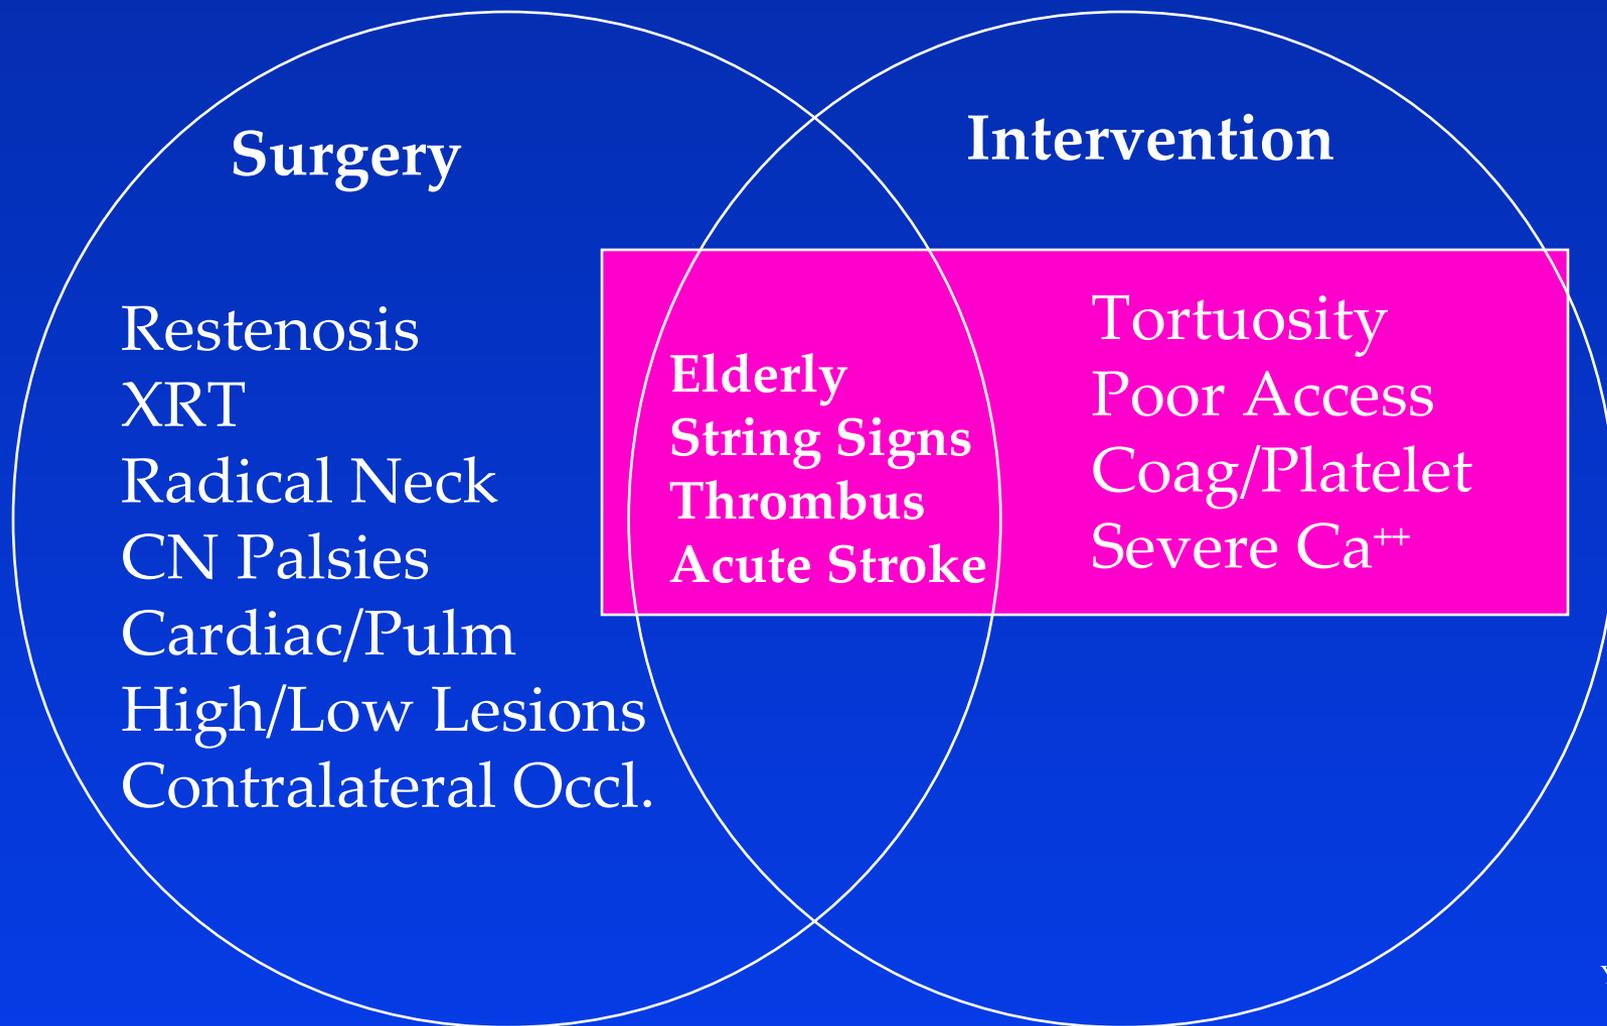

# Carotid Stenting Procedure

---

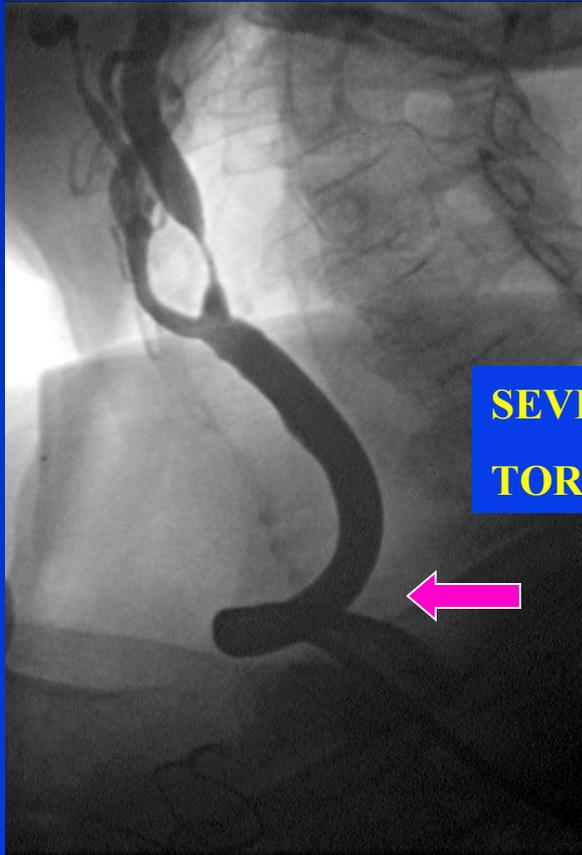

- ◆ **Cerebral Angiogram:**
  - Aortic Arch
  - Ipsilateral oblique & lateral cervical of both Carotids- siphon
  - AP and Lateral Intracranial bilaterally
  - Both subclavians in a contralateral oblique projection for Vert ostia
  - Dominant Vert injection with intracranial lateral and steep cranial AP

# Factors that Increase the Risk of Carotid Revascularization

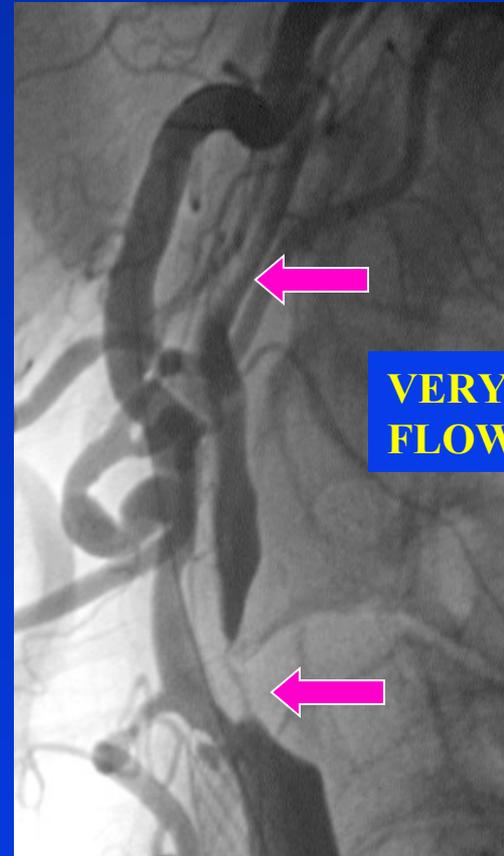

---

# Unfavorable Anatomy

**SEVERE  
TORTUOSITY**

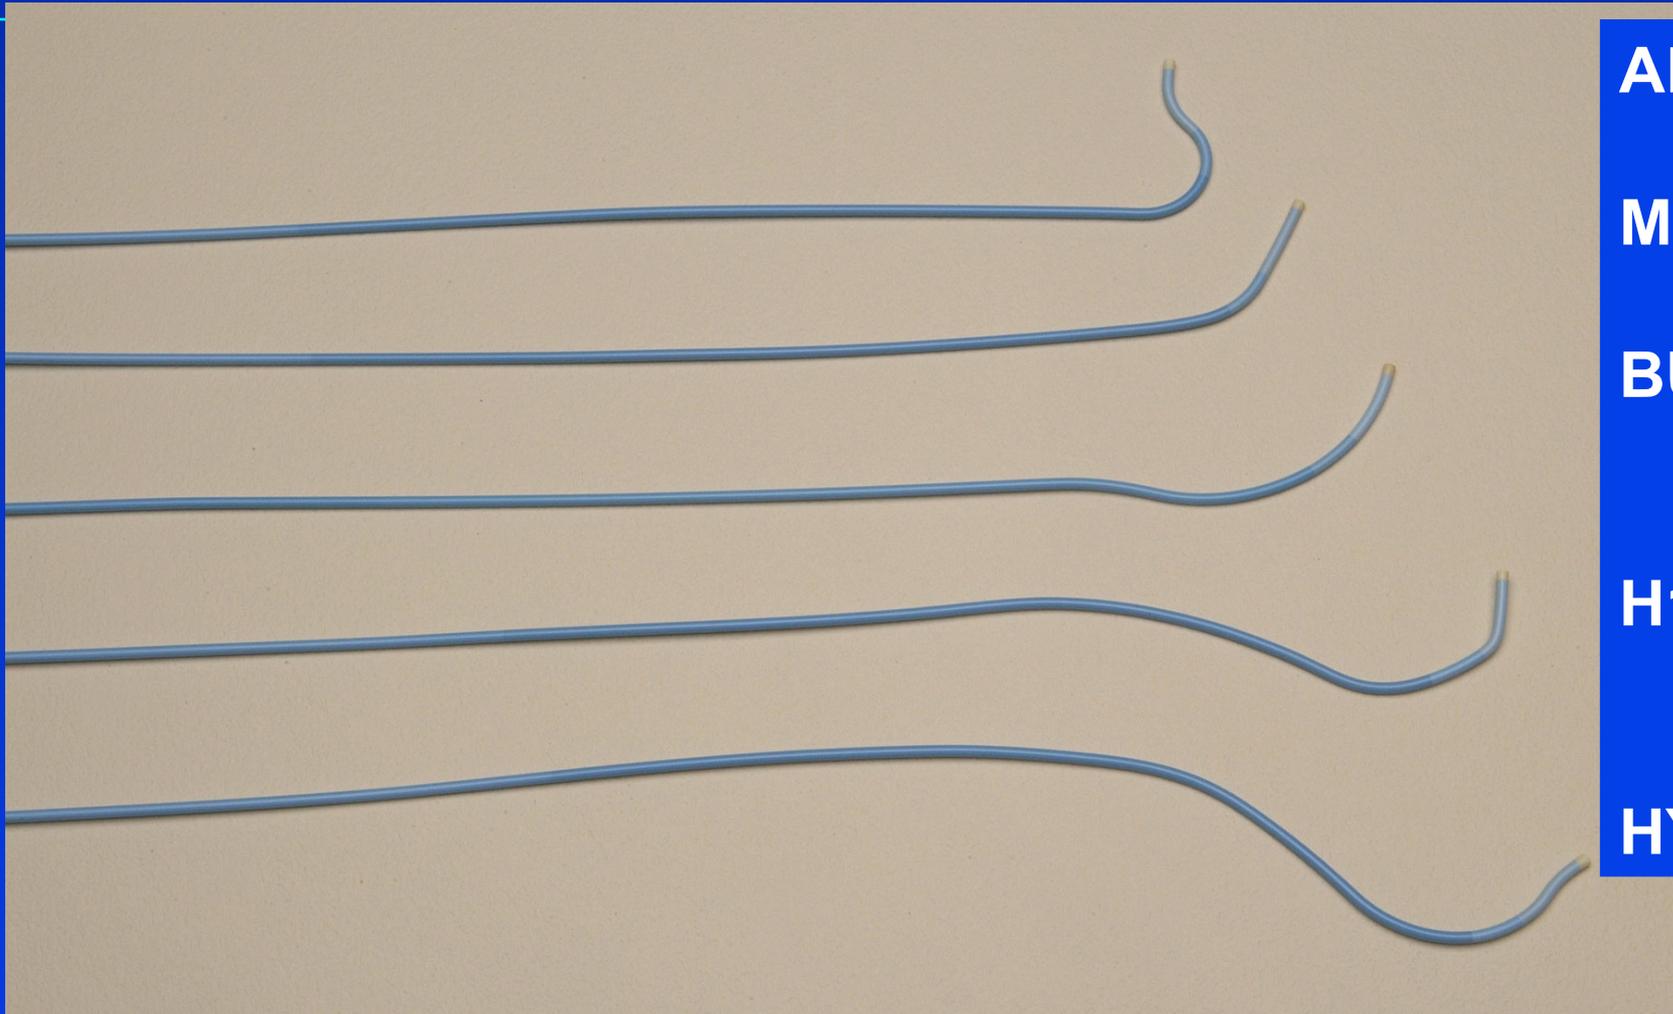

**VERY SLOW  
FLOW**

# Sheaths vs. Guides

Technique	Advantages	Disadvantages
<b>Guide sheath</b>	<p>6–7 F hole in the groin</p> <p>Integrated dilator permits smoother transition and advancement into the CCA (see Fig. 7)</p> <p>Allows placement of diagnostic catheter inside the sheath for one-step access</p>	<p>No torque option</p> <p>Potential for kink in angulated vessel takeoff (anomalous left CCA)</p> <p>Larger volume of contrast, slightly greater risk of air embolism</p>
<b>Guide catheter</b>	<p>Better torque control</p> <p>Least chance for kink</p> <p>Allows retrieval of filters by advancement into the stent.</p> <p>The torque control allows orientation of the guide catheter towards ICA better in tortuous anatomy</p>	<p>8 F hole in the groin</p> <p>During advancement over 0.035-inch guide wire into the CCA, the abrupt transition at the tip may predispose to scraping and emboli</p> <p>Difficult to place diagnostic catheter inside guide catheter for one step access, the relative stiffness and size mismatch do not provide smoother transition</p>

CCA: common carotid artery; ICA: internal carotid artery.

# TELESCOPING ACCESS SETUP

---

**STIFF ANGLED GLIDE WIRE**

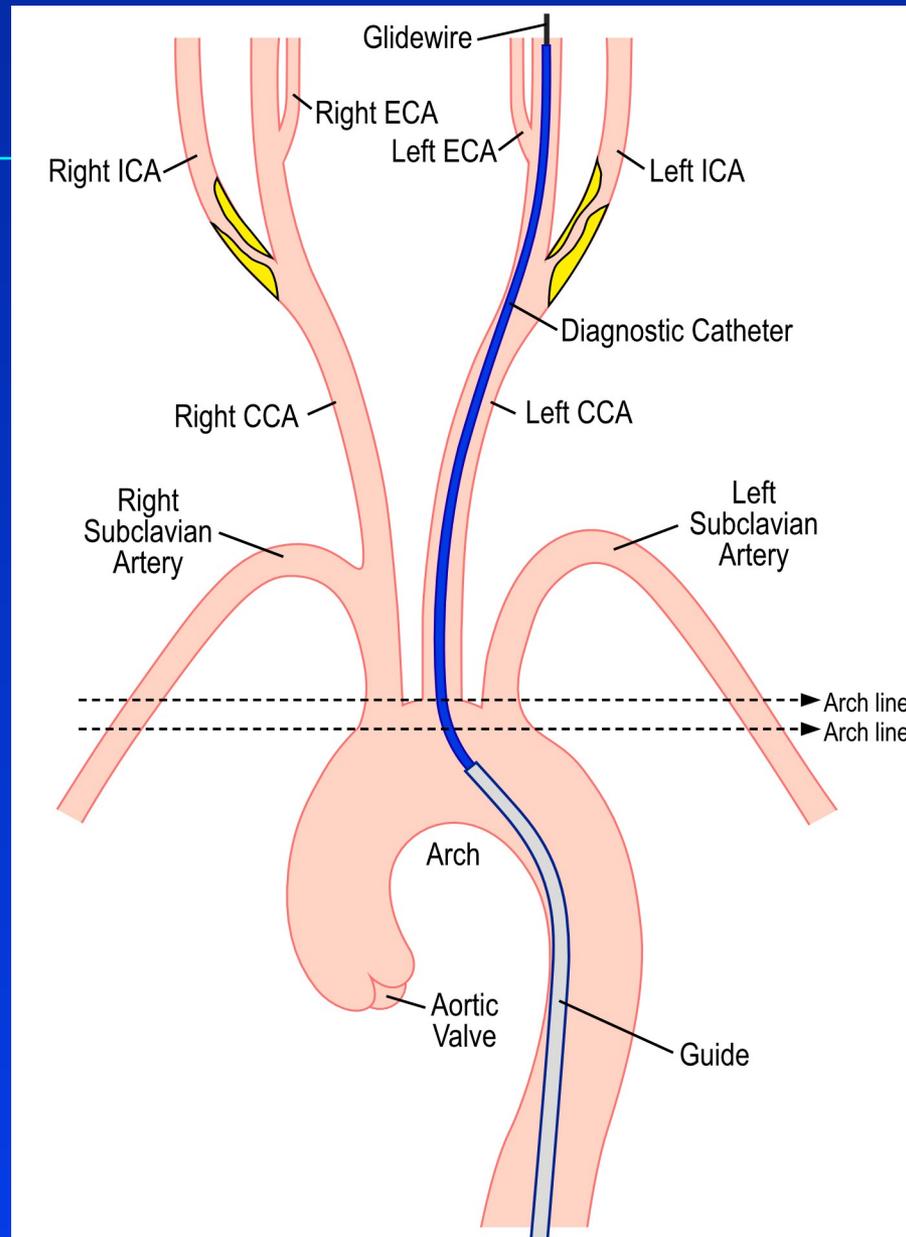

**CORDIS H1 GUIDE:  
8 FR**

**JR4: 5 FR, 125 CM  
OR VITEK**

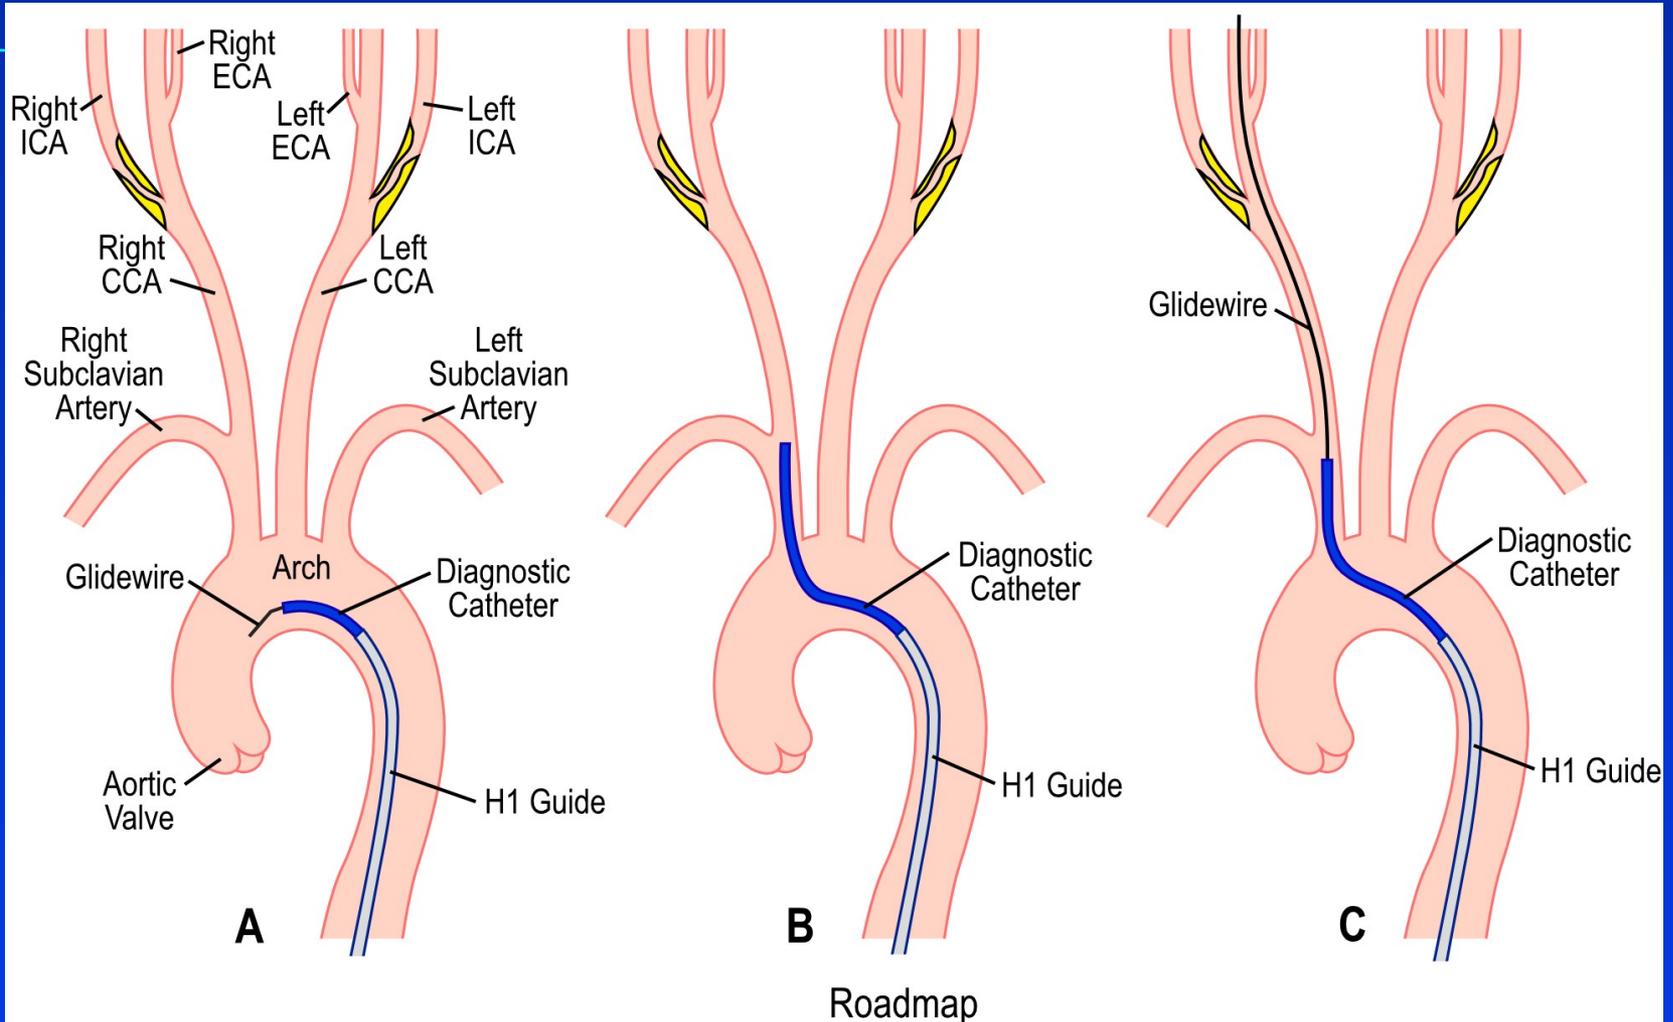

**COOK 6 FR SHEATH**

# Telescoping Access for Carotid Stenting

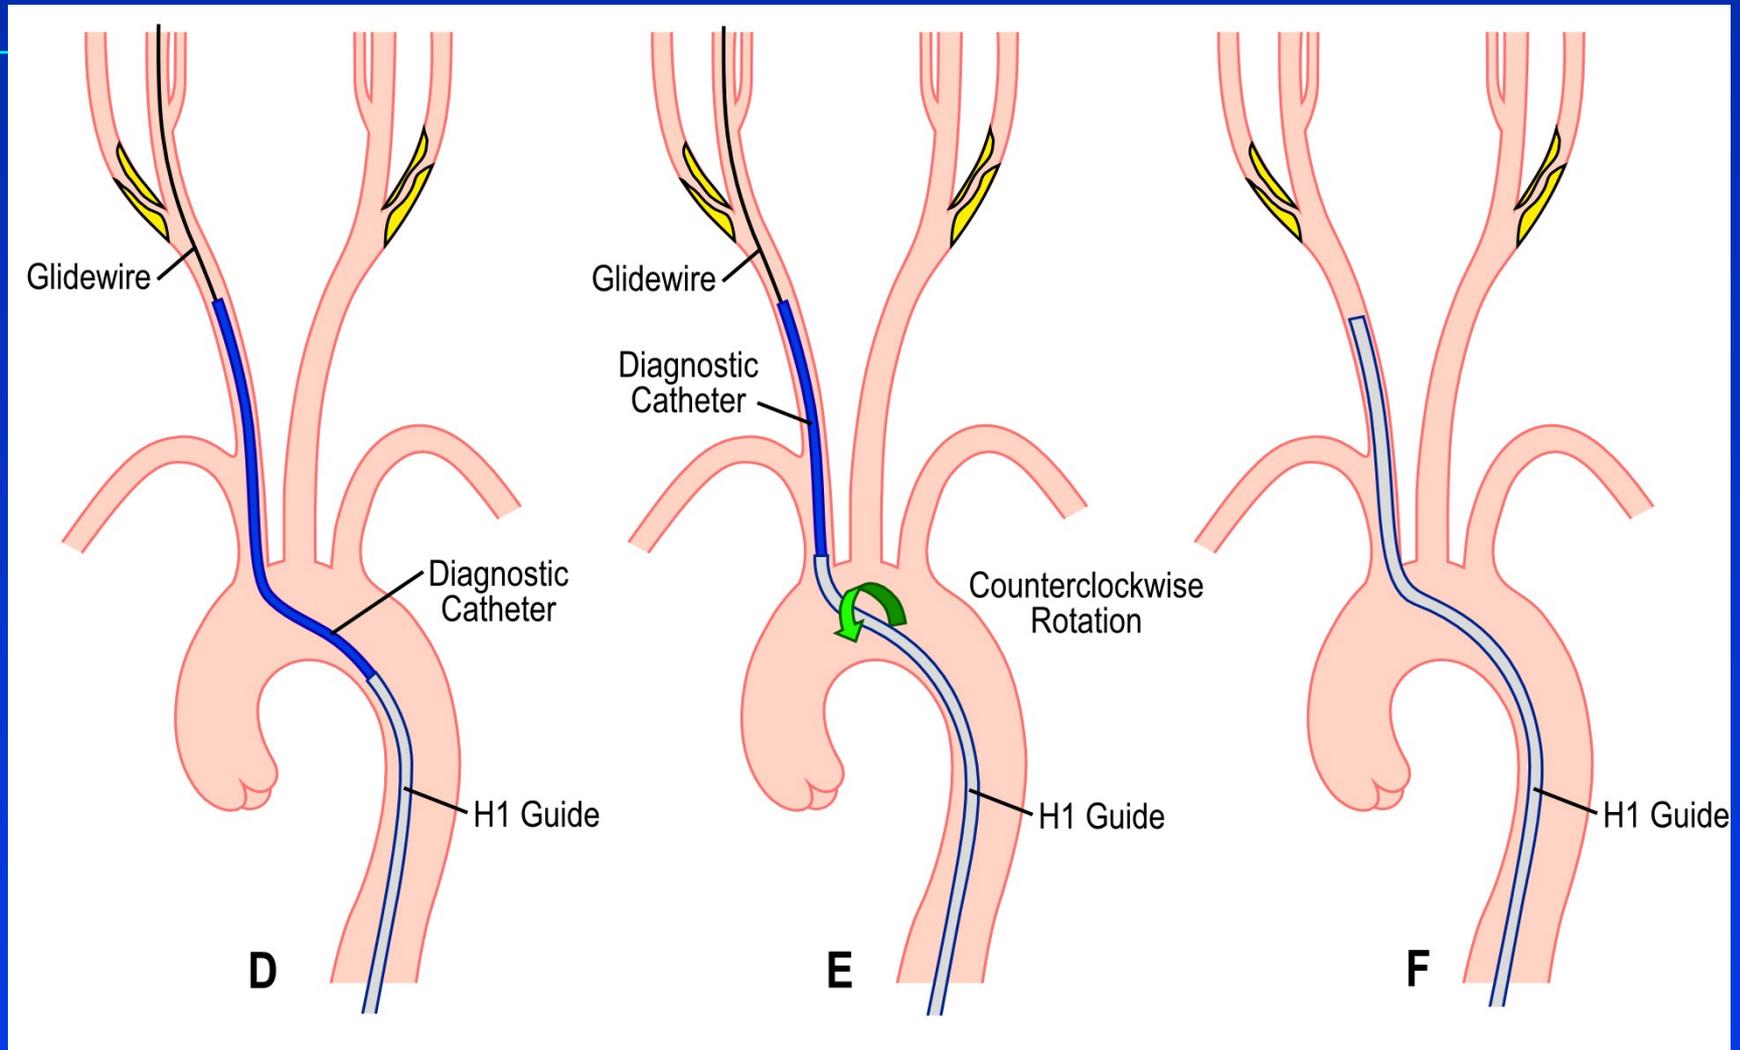

Ref 15

# Access Strategies for Carotid Stenting: Telescoping Technique

# Access Strategies for Carotid Stenting: Telescoping Technique

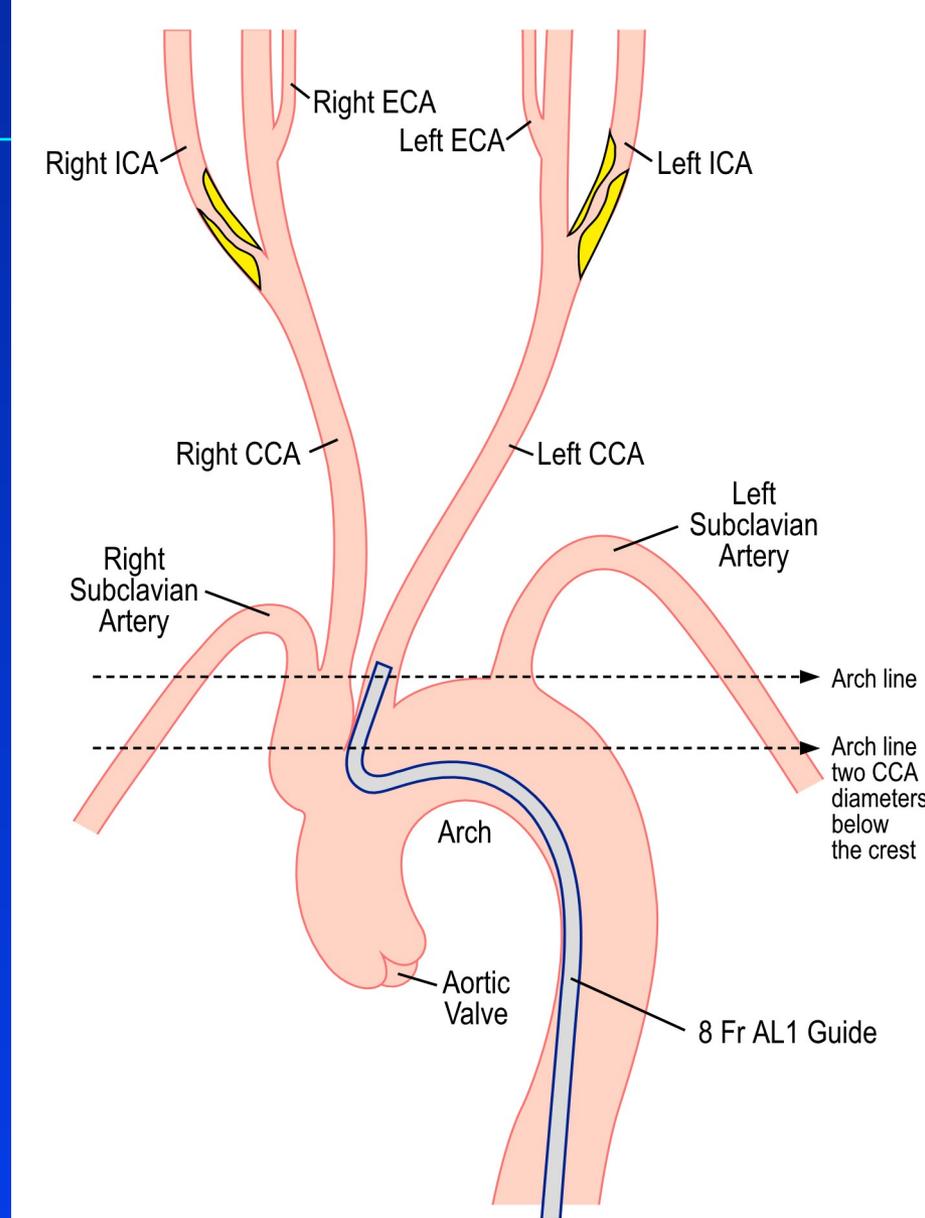

# Access Strategies for Carotid Stenting

---

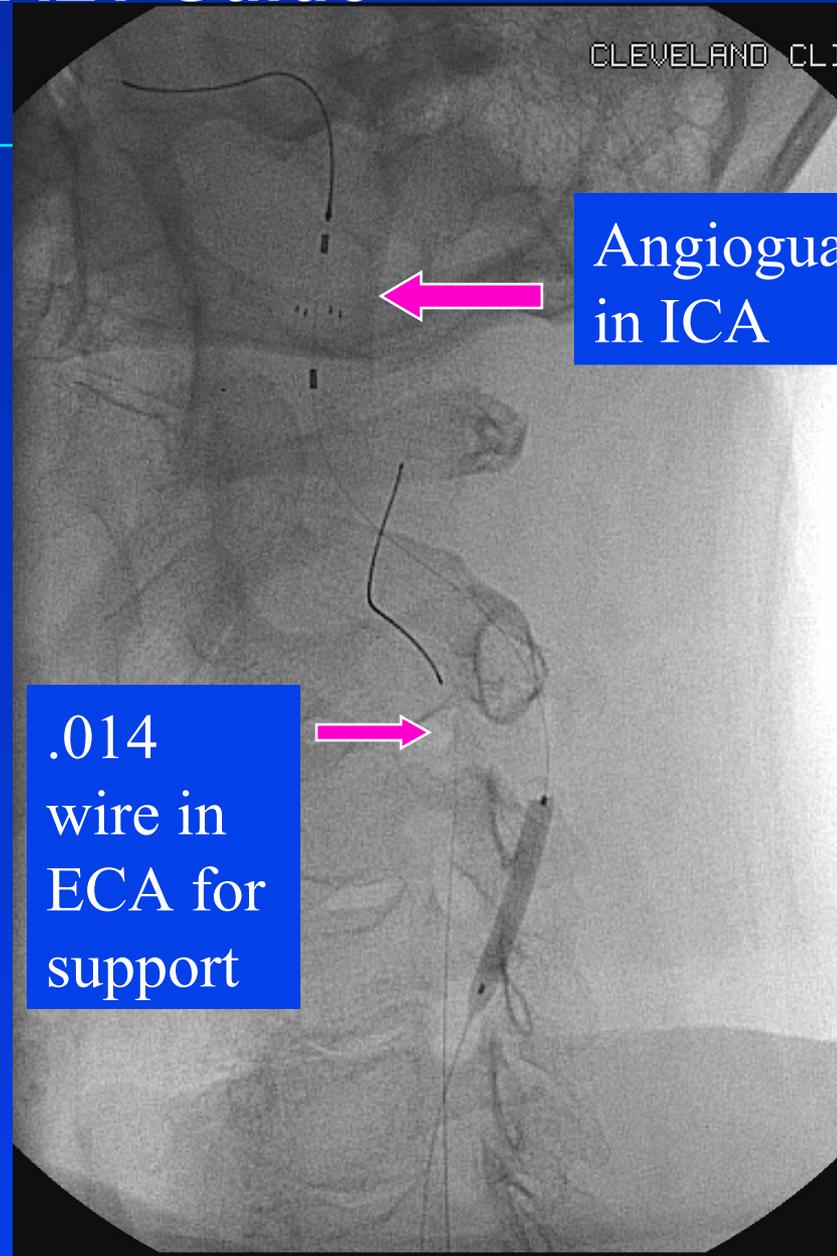

- ◆ **Coronary Technique – Type I or II Arch**
  - Guide over Stiff angled Glide Wire, engage CCA directly, keep proximal to low mid
- ◆ **Bovine Arch-**
  - Reshaped Amplatz 1 Guide
  - Stiff 0.014 or 0.018 buddy wire into ECA

# Access Strategies for Carotid Stenting: Direct Guide Catheter Approach

# *Buddy Wire in ECA for Support in Bovine L CCA engaged with AL1 Guide*

Angioguard  
in ICA

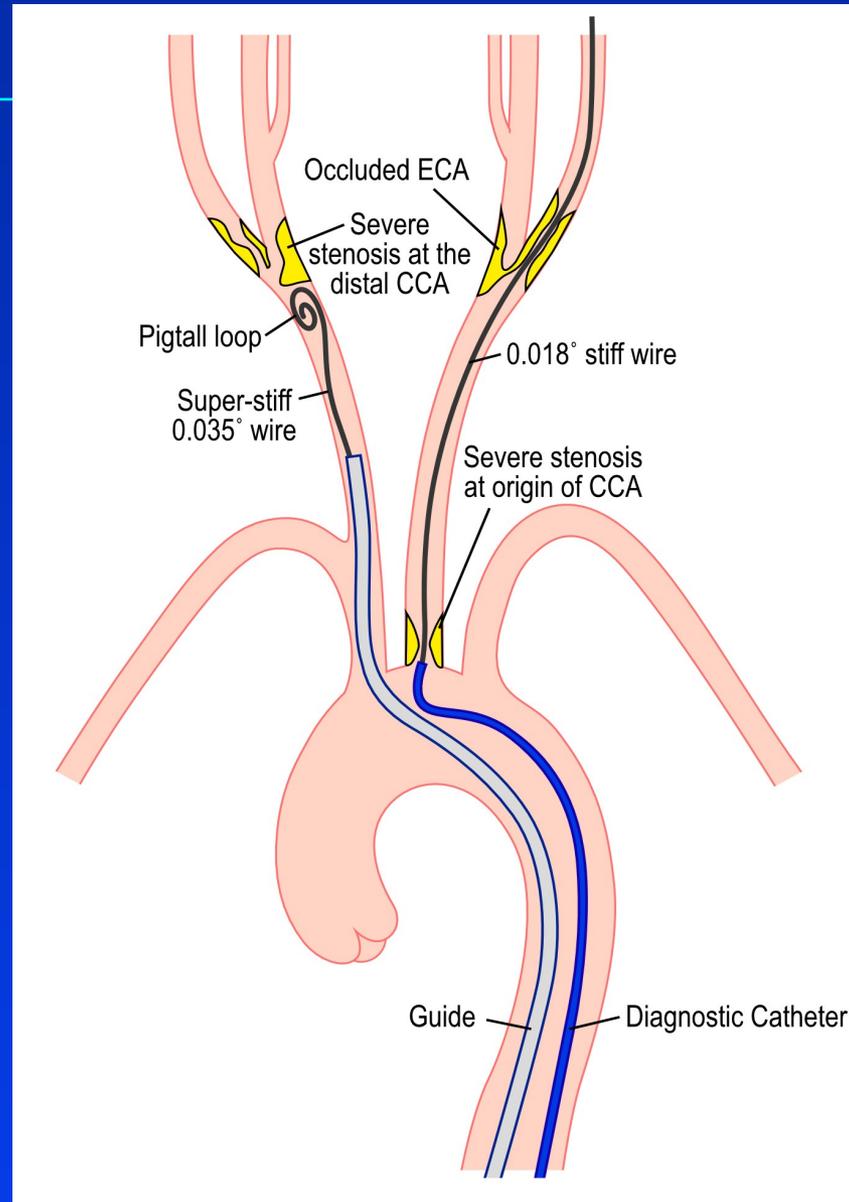

.014  
wire in  
ECA for  
support

# Access Strategies for Carotid Stenting

---

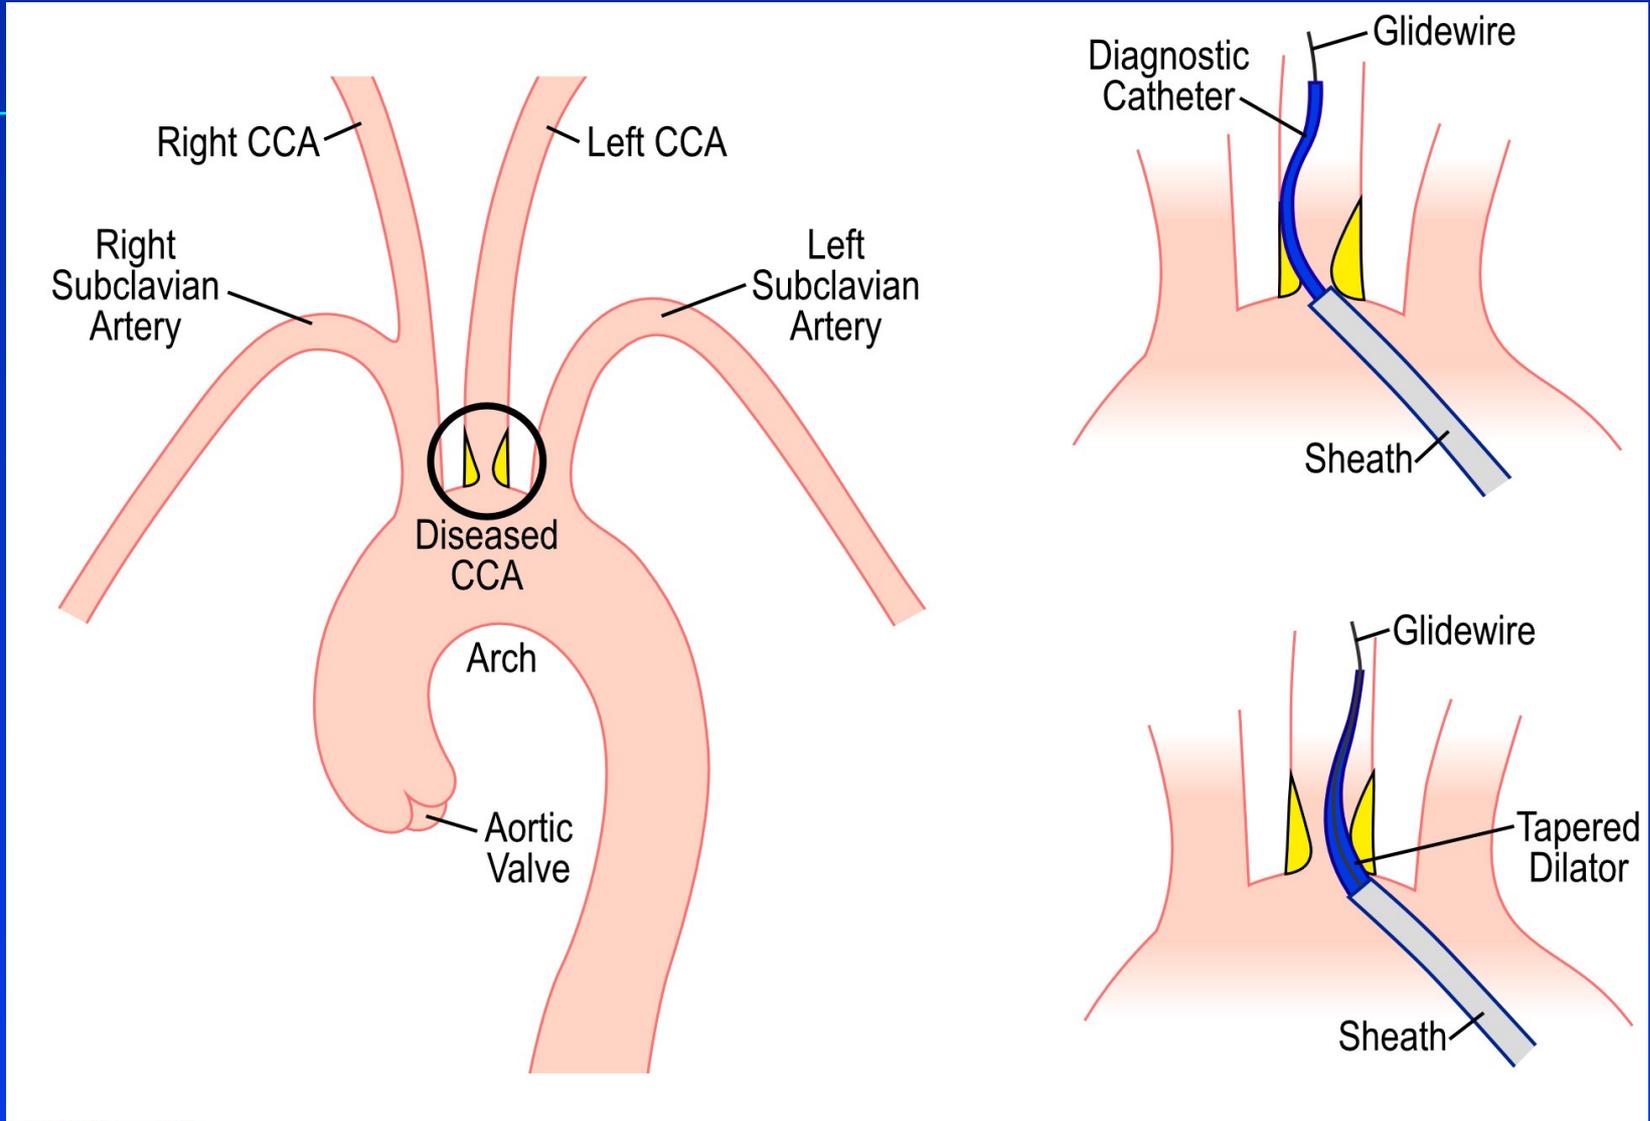

- ◆ **Type III (severe)-**
  - **Vitek or Simmons 1.5 over Stiff Glide**
  - **Place DX cath into ECA**
  - **Exchange for Super Stiff Amplatz Wire with 3 cm tip**
  - **Remove Dx Cath**
  - **Place Guide/Dx Cath or Sheath/Introducer over Amplatz Wire**

# Approaches in Presence of Severe ECA or CCA Disease

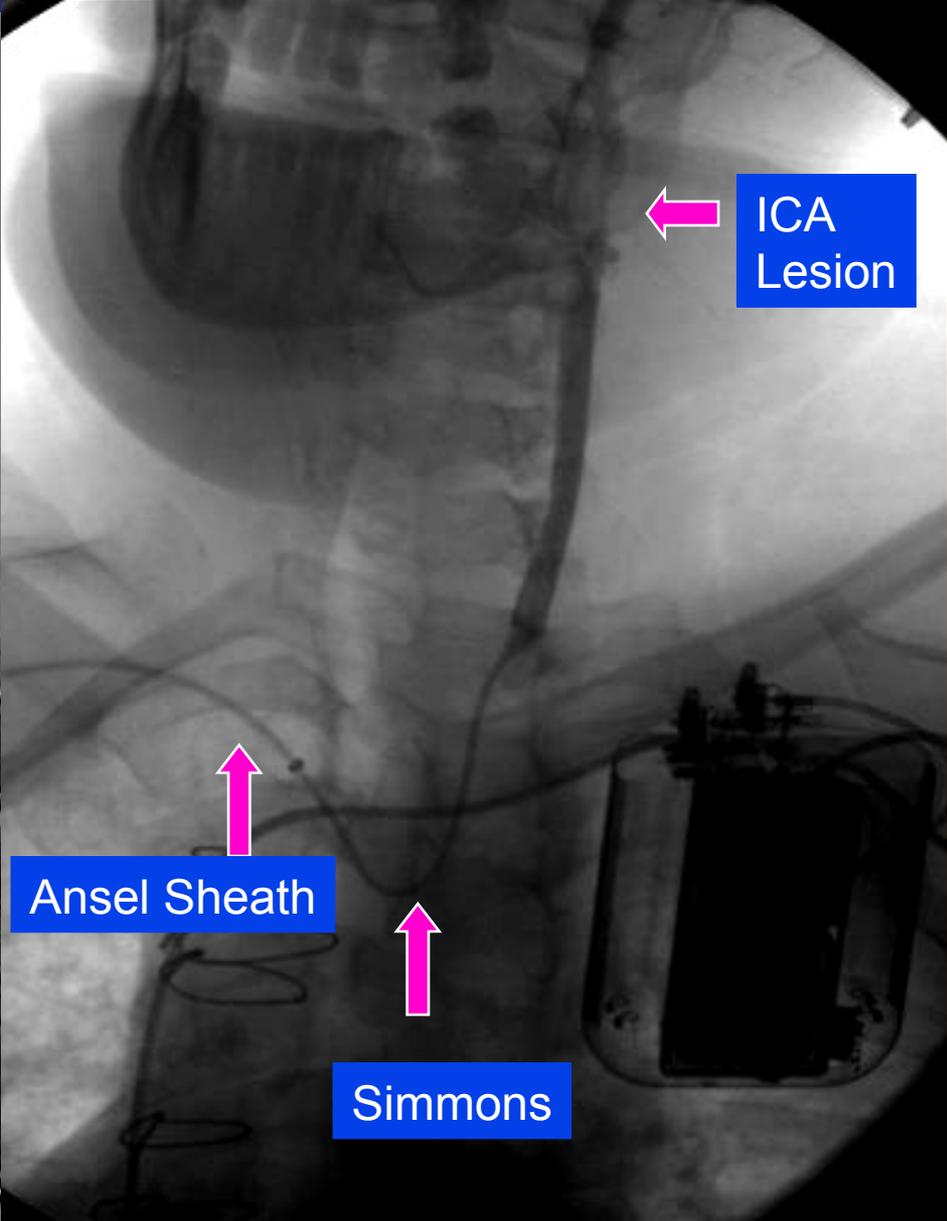

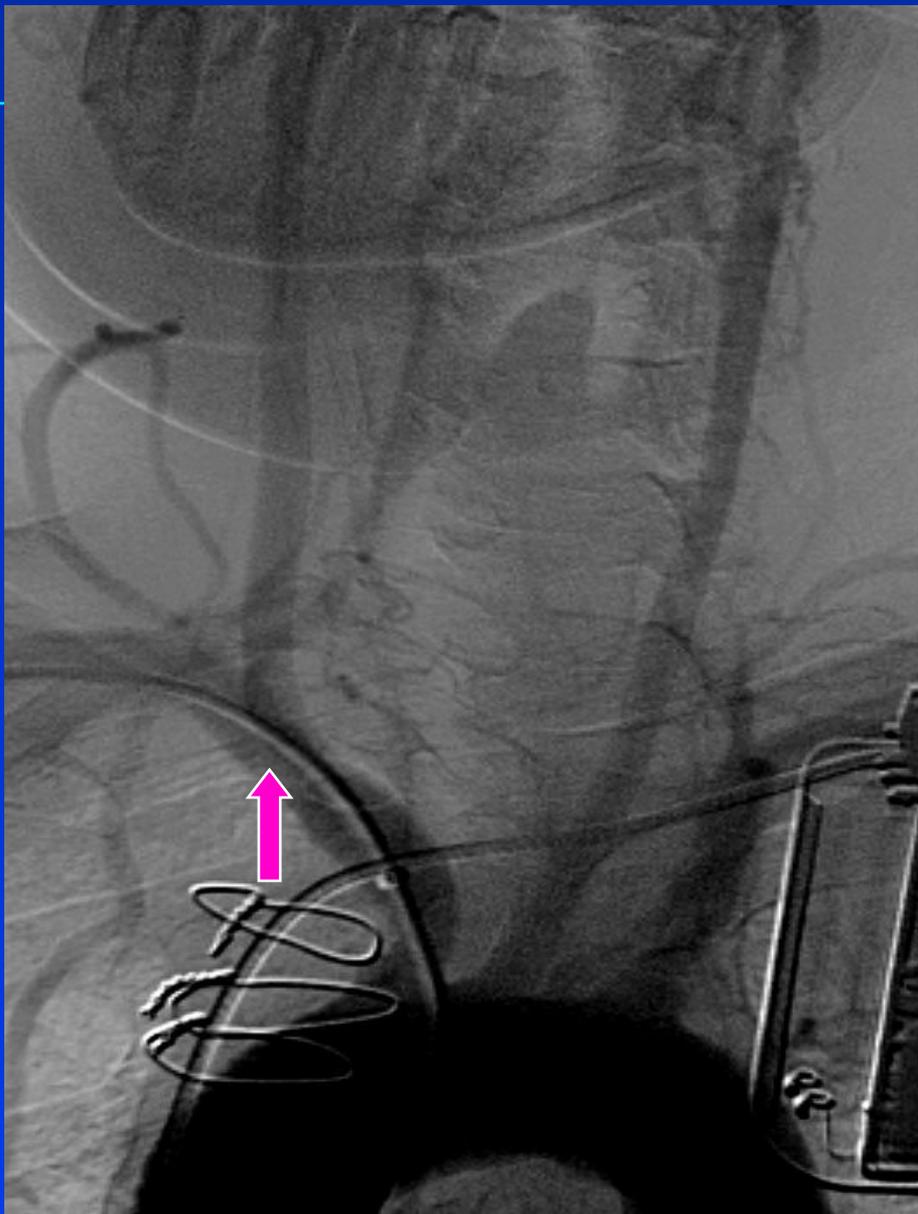

Ref 14

# Approach in Presence of Mild CCA Ostial Disease

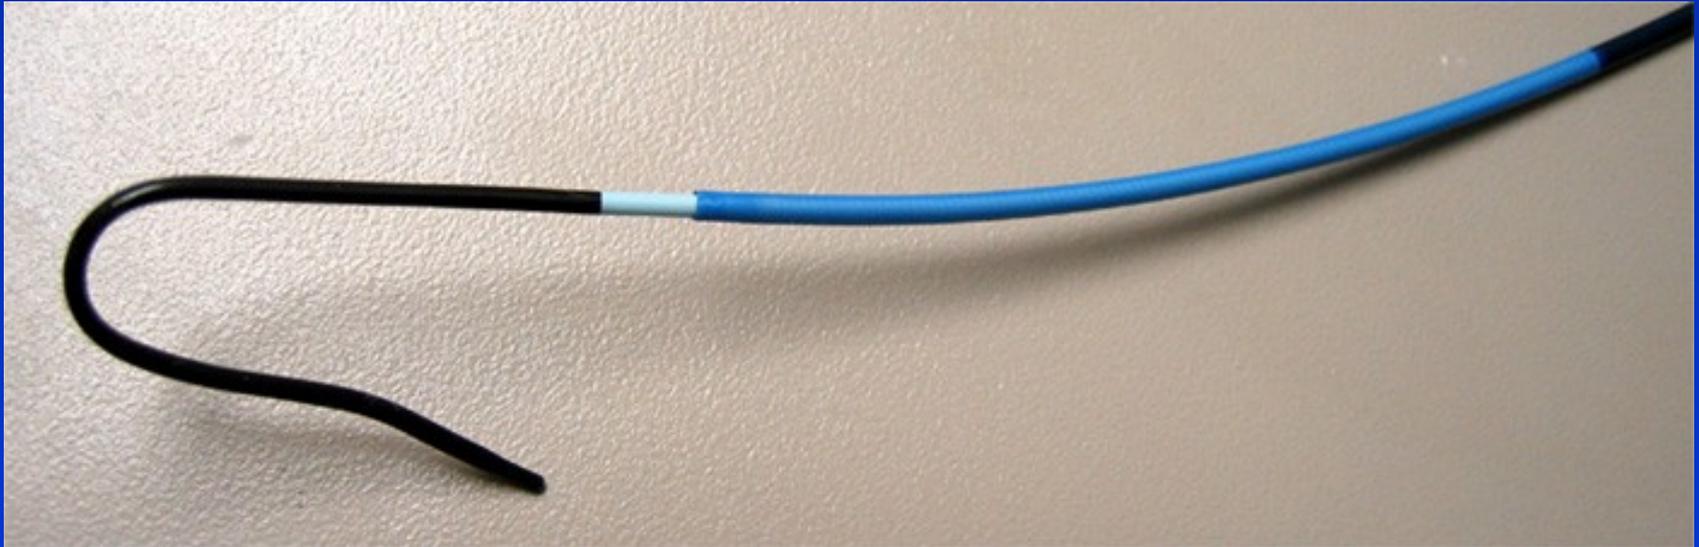

# Brachial Approach in the Absence of Femoral Access.

**Access.** Pt with bilateral AKA, 2 CABGs, Recent MI, Pending 3<sup>rd</sup> CABG

# Emboli Prevention Devices

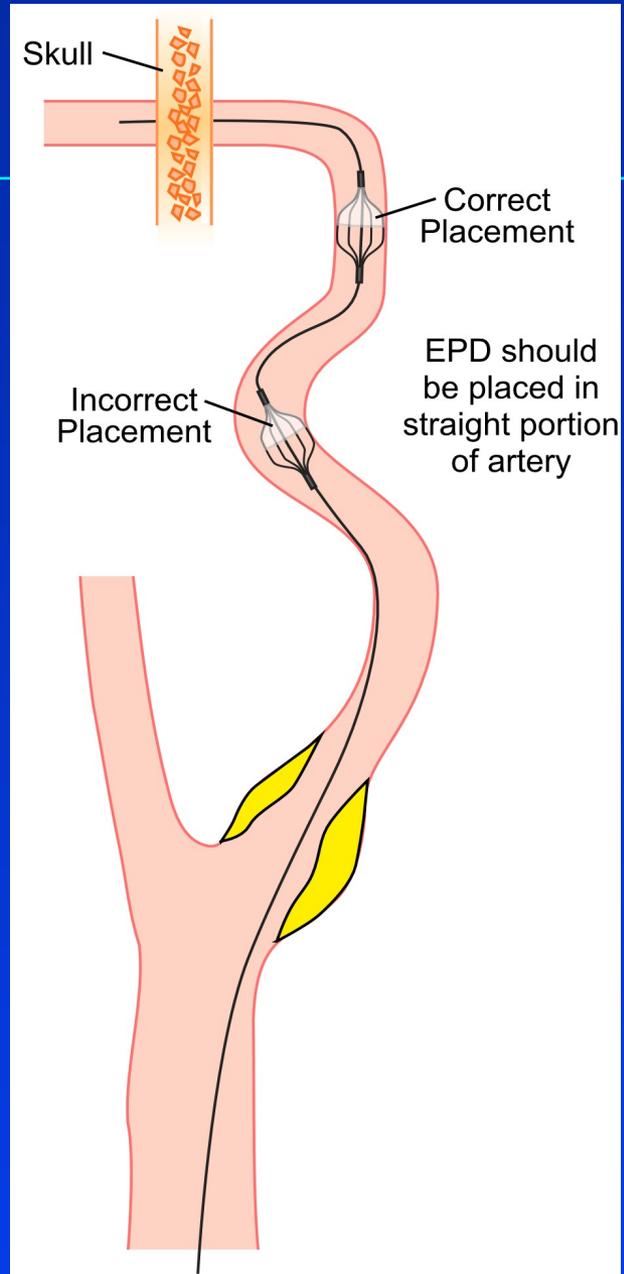

## Filters

## Occlusive

# Proper Placement of EPDs

# Emboli Prevention Devices

---

- ◆ **Guide Support is Critical**
  - Deployed EPD may be pulled down through lesion
- ◆ **Distal tortuosity**
- ◆ **Less support and control**
- ◆ **Ischemic Intolerance with balloon occlusion – check for collaterals**

# Emboli Prevention Devices

---

- ◆ Filters may develop slow or no flow
- ◆ Particularly with soft, large plaques
- ◆ Do not immediately capture and withdraw filter
- ◆ Static column of blood with suspended particles that will embolize when filter is collapsed
- ◆ Aspirate with 125 cm 5 Fr MP catheter before capturing filter

# Management of Filters with Slow Flow

---

---

# Difficulty with Access and Crossing with Filter

# Issues Affecting Passage of Filter EPD in Tortuous Vessels

---

- ◆ Carotid Artery is fixed in position at the aortic arch and at the base of the skull. If one area is straightened, tortuosity or redundancy elsewhere will be worsened.
  - Common Carotid Artery
    - » Proximal Tortuosity will be transmitted to ICA if the proximal vessel is straightened by a sheath/guide
- ◆ Internal Carotid Artery
  - Angle of Takeoff of ICA from CCA
  - Calcification of ICA
  - Extra-cranial Tortuosity distal to origin

# Issues Affecting Passage of Filter EPD in Tortuous Vessels

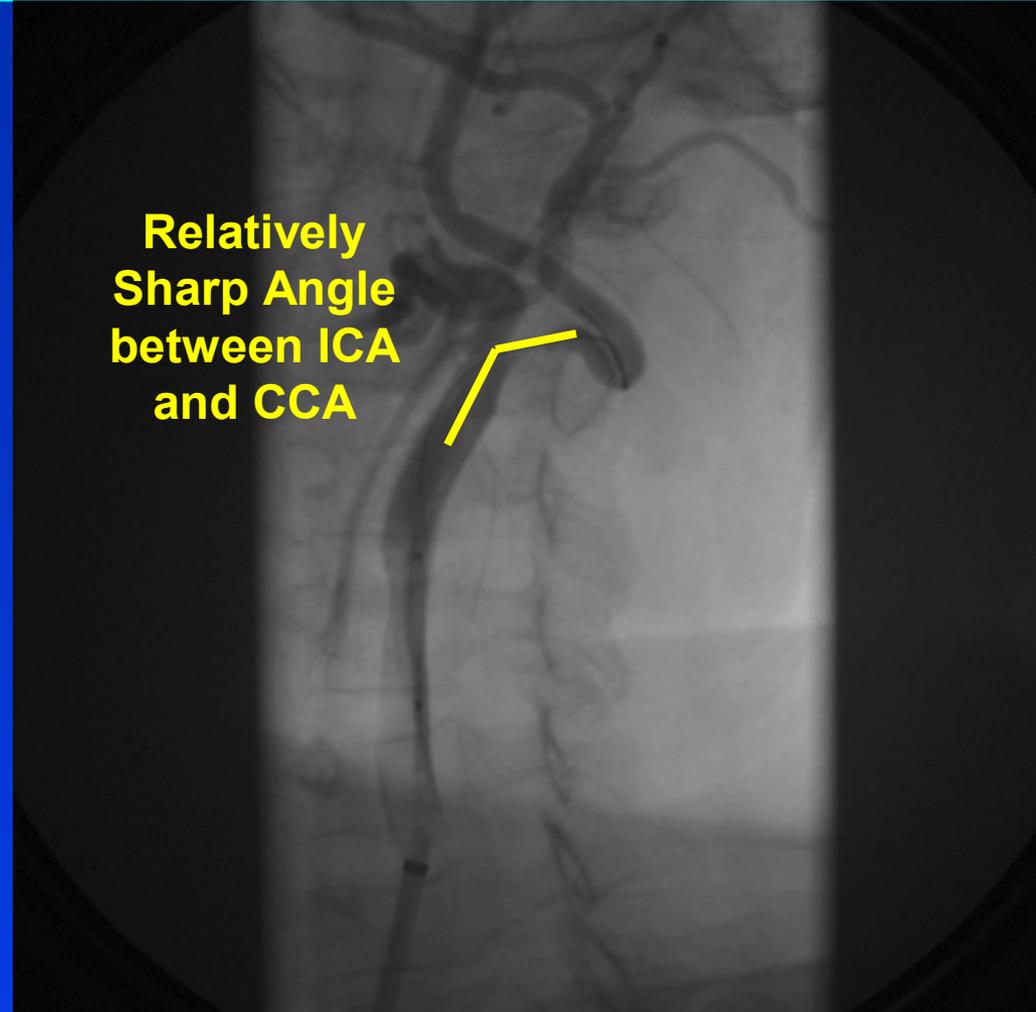

---

## ◆ Support

- **8 Fr Sheath > 8 Fr Guide > 6 Fr Sheath**
- Guide may be able to direct EPD at better angle

- ◆ EPD – Filter of EPD is relatively inflexible. The length of the filter may adversely affect passage of EPD in tortuous ICA's.

# Angle of Takeoff of ICA from CCA

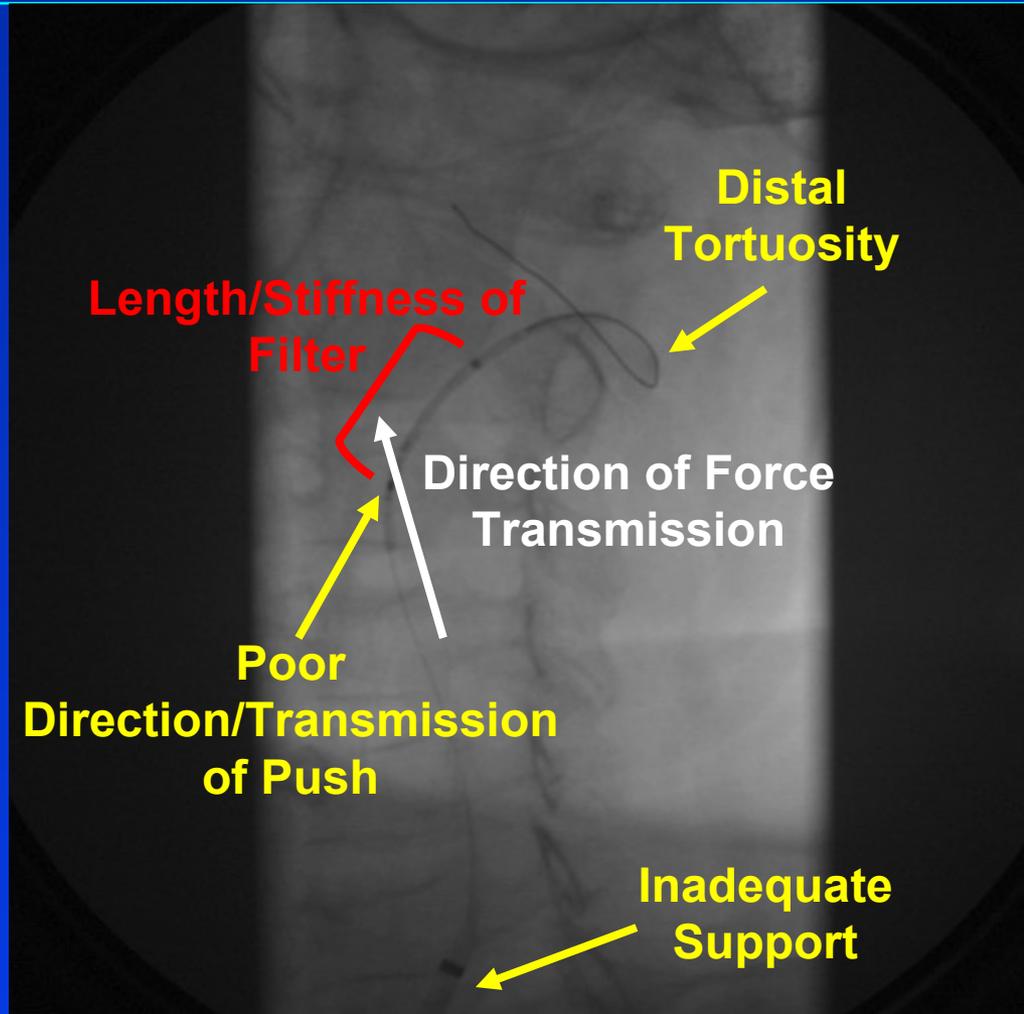

# Analysis of Passage Failure

---

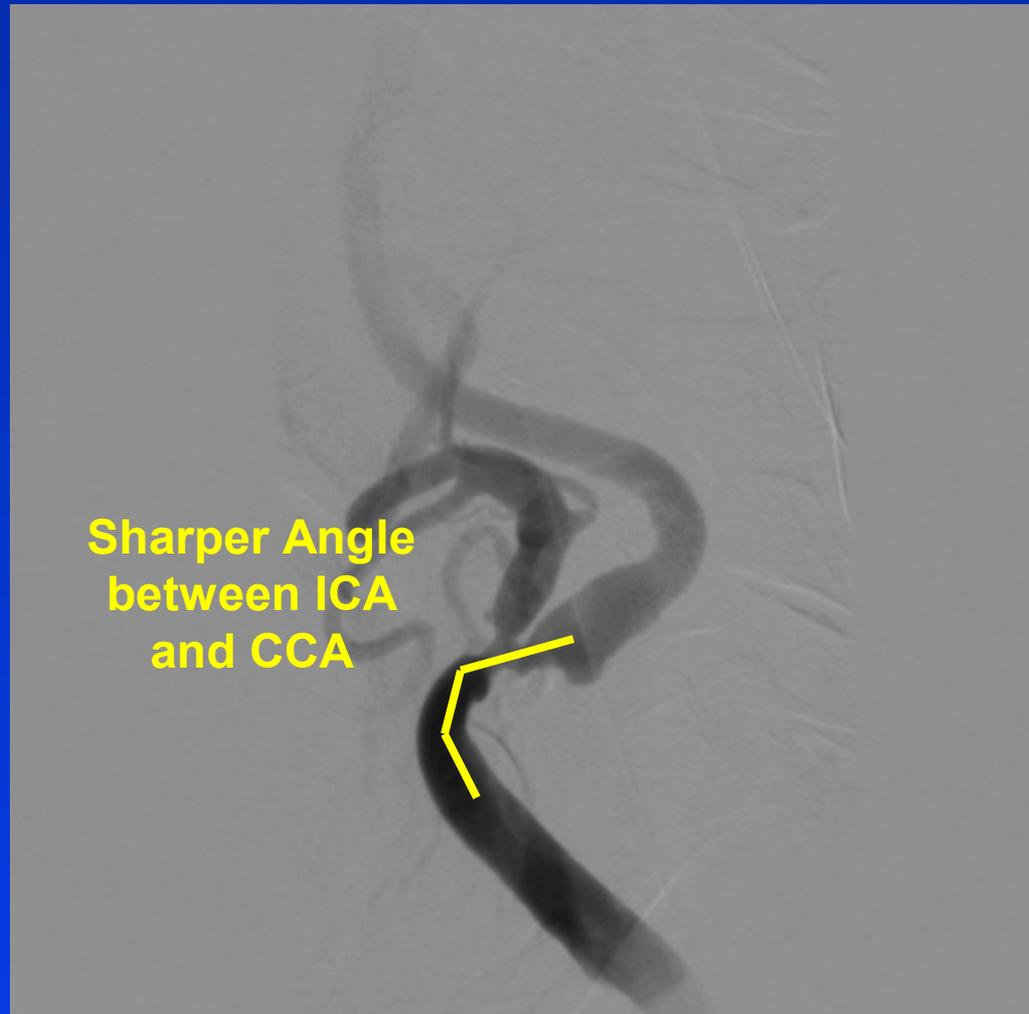

# Analysis of Passage Failure

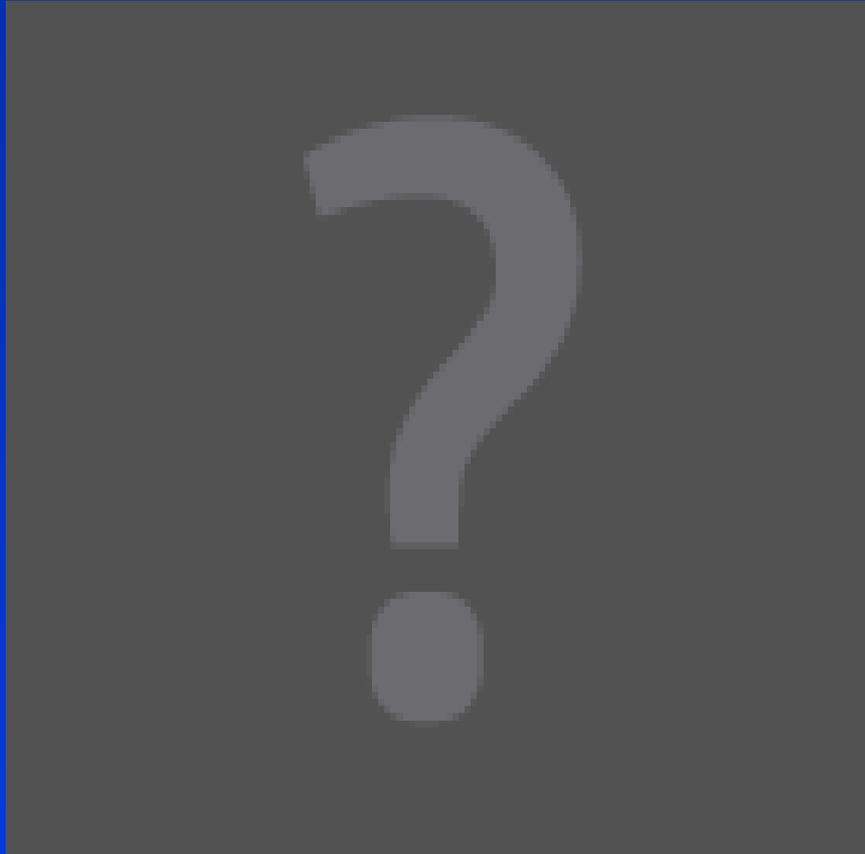

# Sharp Angle / Tortuosity

## Example 2

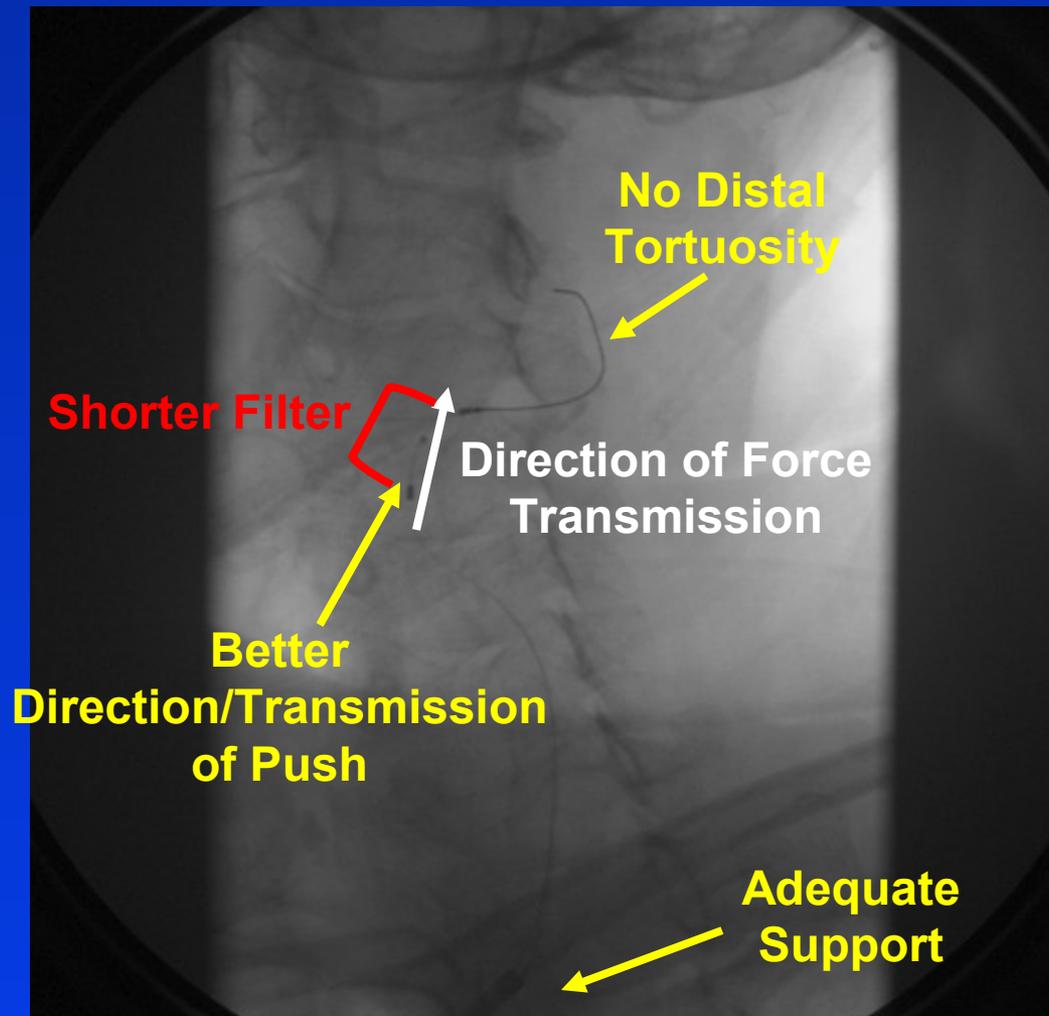

# Passage of EPD through ICA with Sharp Angle

---

# Passage of EPD through ICA with Sharp Angle

# Issues Affecting Passage of Filter EPD in Tortuous Vessels

---

## ◆ Strategies

- Use either 8 Fr Guide or 8 Fr Sheath for better support
- Use EPD with better passage profile
- Use buddy wire in either ECA or ICA
  - » Use 0.014 wire in ICA, 0.014-0.035 in ECA
  - » Buddy wires in ICA should improve angle and tortuosity without causing **pseudostenosis**. If pseudostenosis results, consider using less stiff wire as buddy or place in ECA.
- As last resort, predilate (which changes angle, severity of stenosis, and compliance of ICA origin).

# Severe LICA stenosis

---

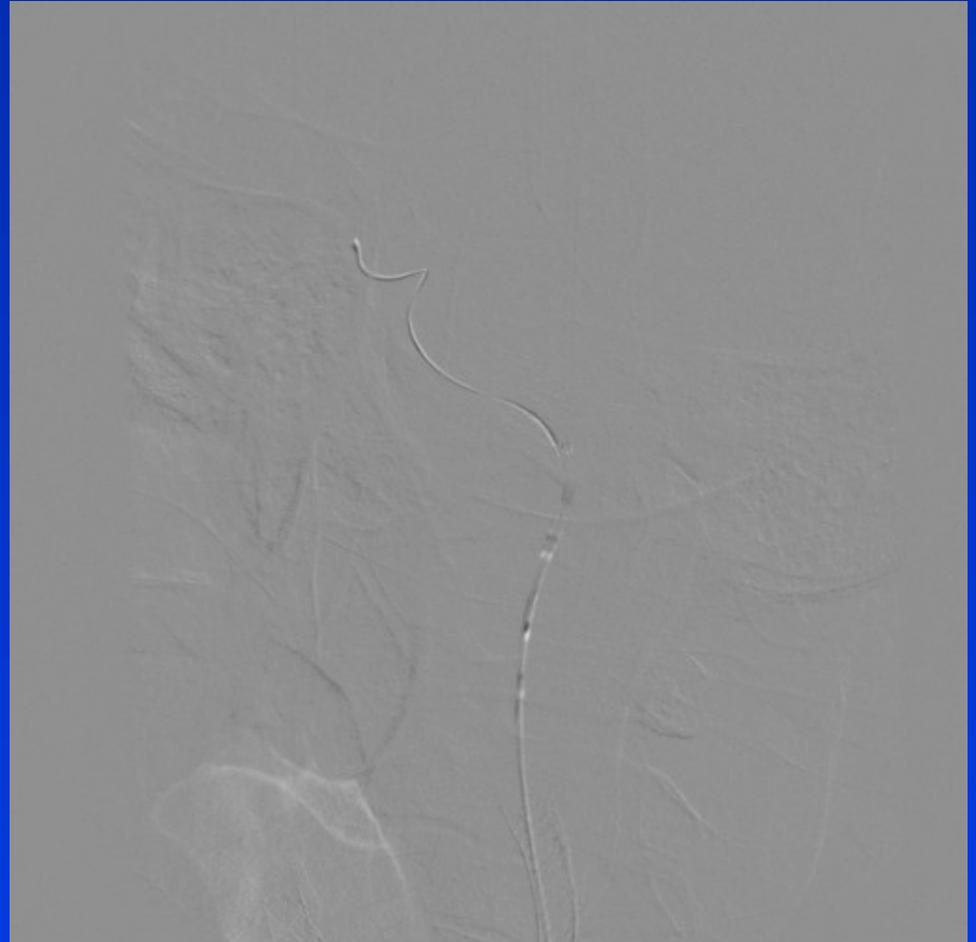

- 8.0/40mm Acculink stent

# EPD Retrieval: Cine Run

---

- Unable to retrieve AccUNET Filter
- Discontinuity between filter and 0.014 inch wire
  - Wire moved independently of filter
- Repeated attempts to use retrieval sheath results in diffuse spasm and TIMI 0 flow

# Attempt to Snare Filter

---

- 0.014 inch hydrophilic Whisper wire advanced distal to filter position
- Attempts to snare filter with 4mm and 5mm Microvena Gooseneck snare unsuccessful

# Petrous Carotid Stent Deployment

---

- 4.0/8 Vision stent

# Cerebral Angio: Left hemisphere

---

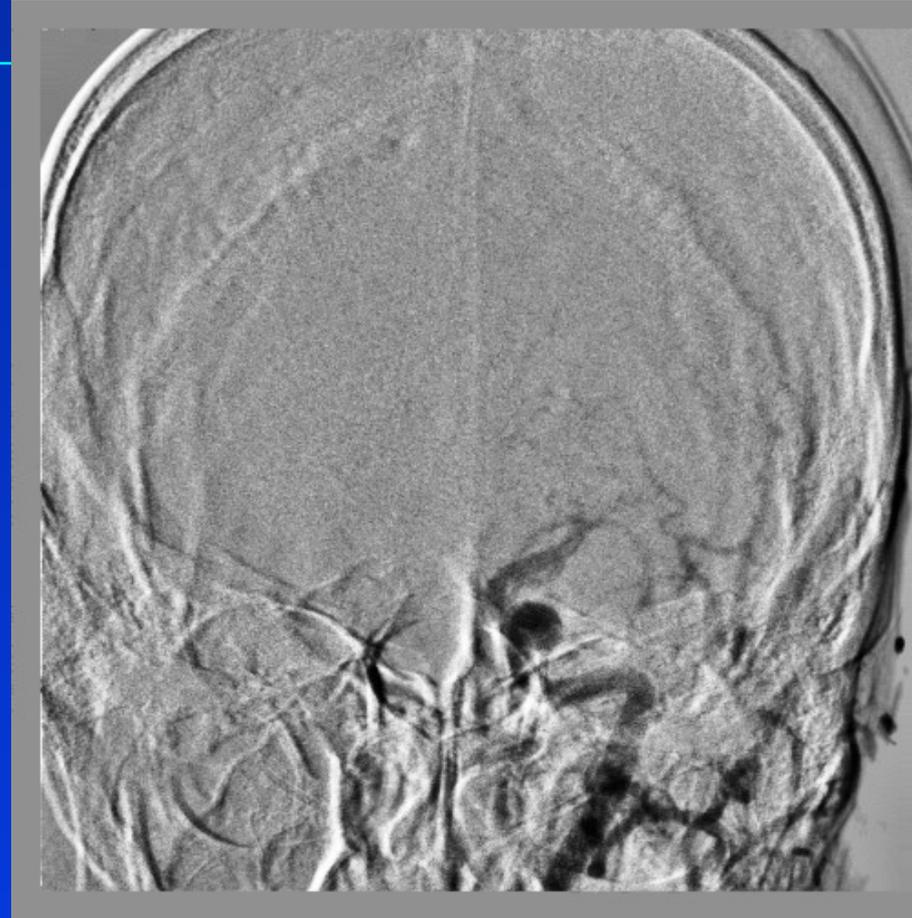

# Rapid Execution

---

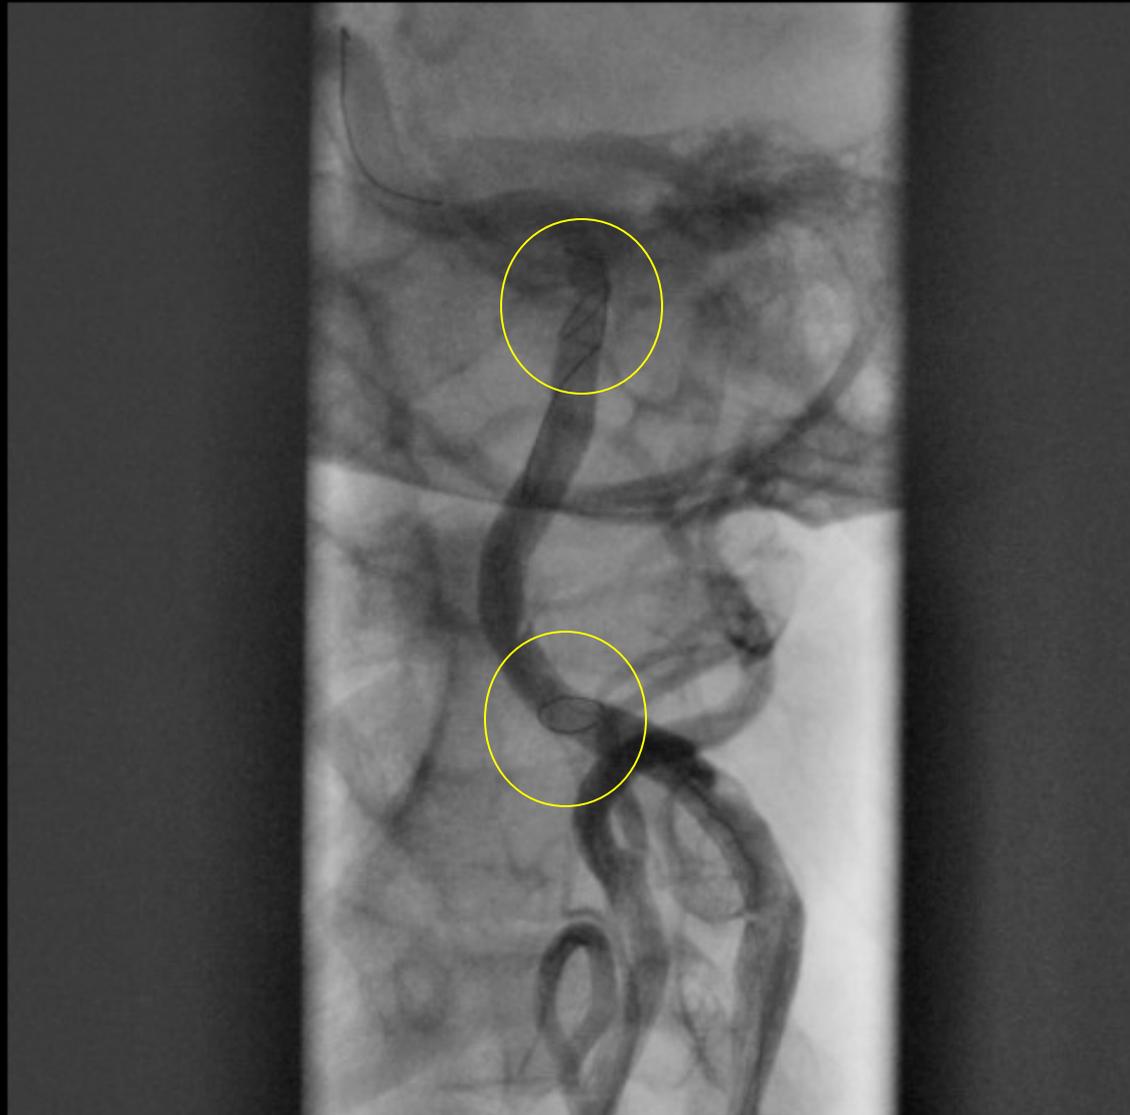

**Prolonged Filter  
Dwell Times  
associated with  
Increased Risk of  
Stroke**

# LICA

- LICA with severe disease and does not fill L hemisphere

# 2<sup>nd</sup> filterwire EZ deployed

# LICA final

# LICA intracranial final

- Left ACA and MCA now fill from LICA

# Double Filter Technique

---

Distal Filter

Proximal Filter

# Pre-dilatation

---

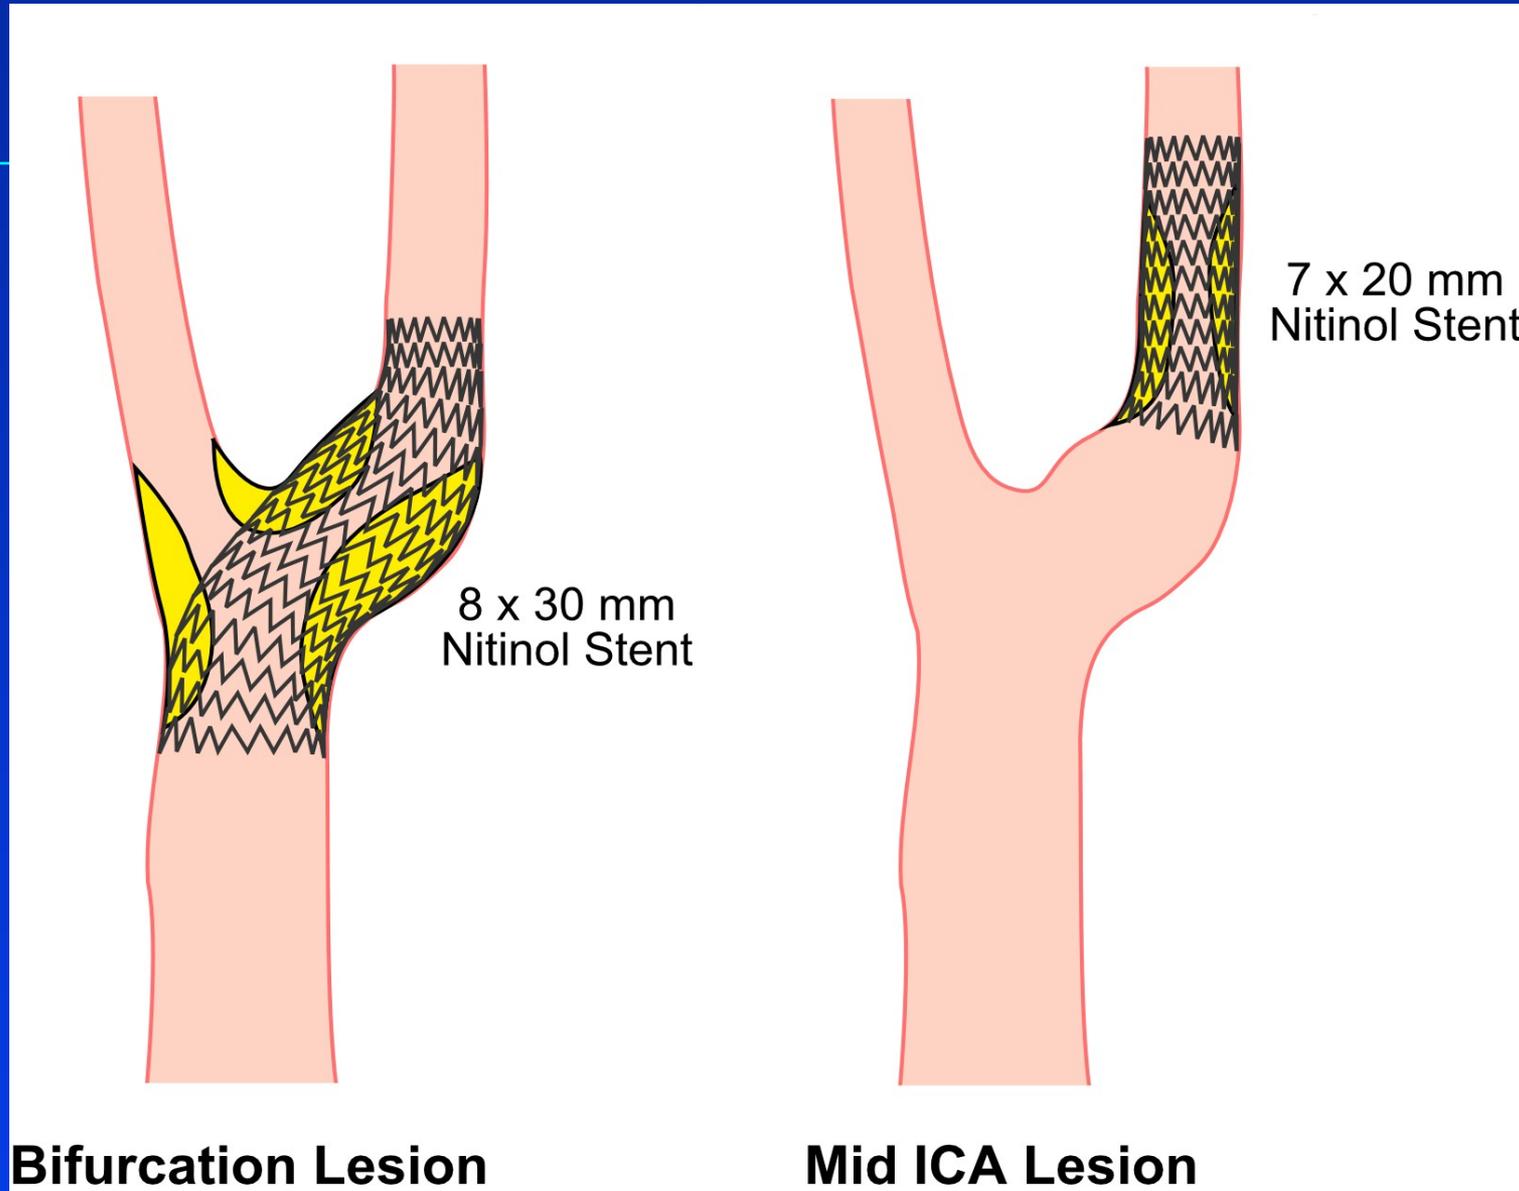

- ◆ **.014** wires
- ◆ Pre-dilatation (2mm balloon) for passage of emboli prevention device
- ◆ 4 x 30 mm vs 4 x 20 mm balloons
- ◆ Duration of pre-dilatation, **long** vs short
- ◆ Obtain large enough lumen for stent passage without resistance
- ◆ No pre-dilatation in certain lesions

# Balloons and Stents

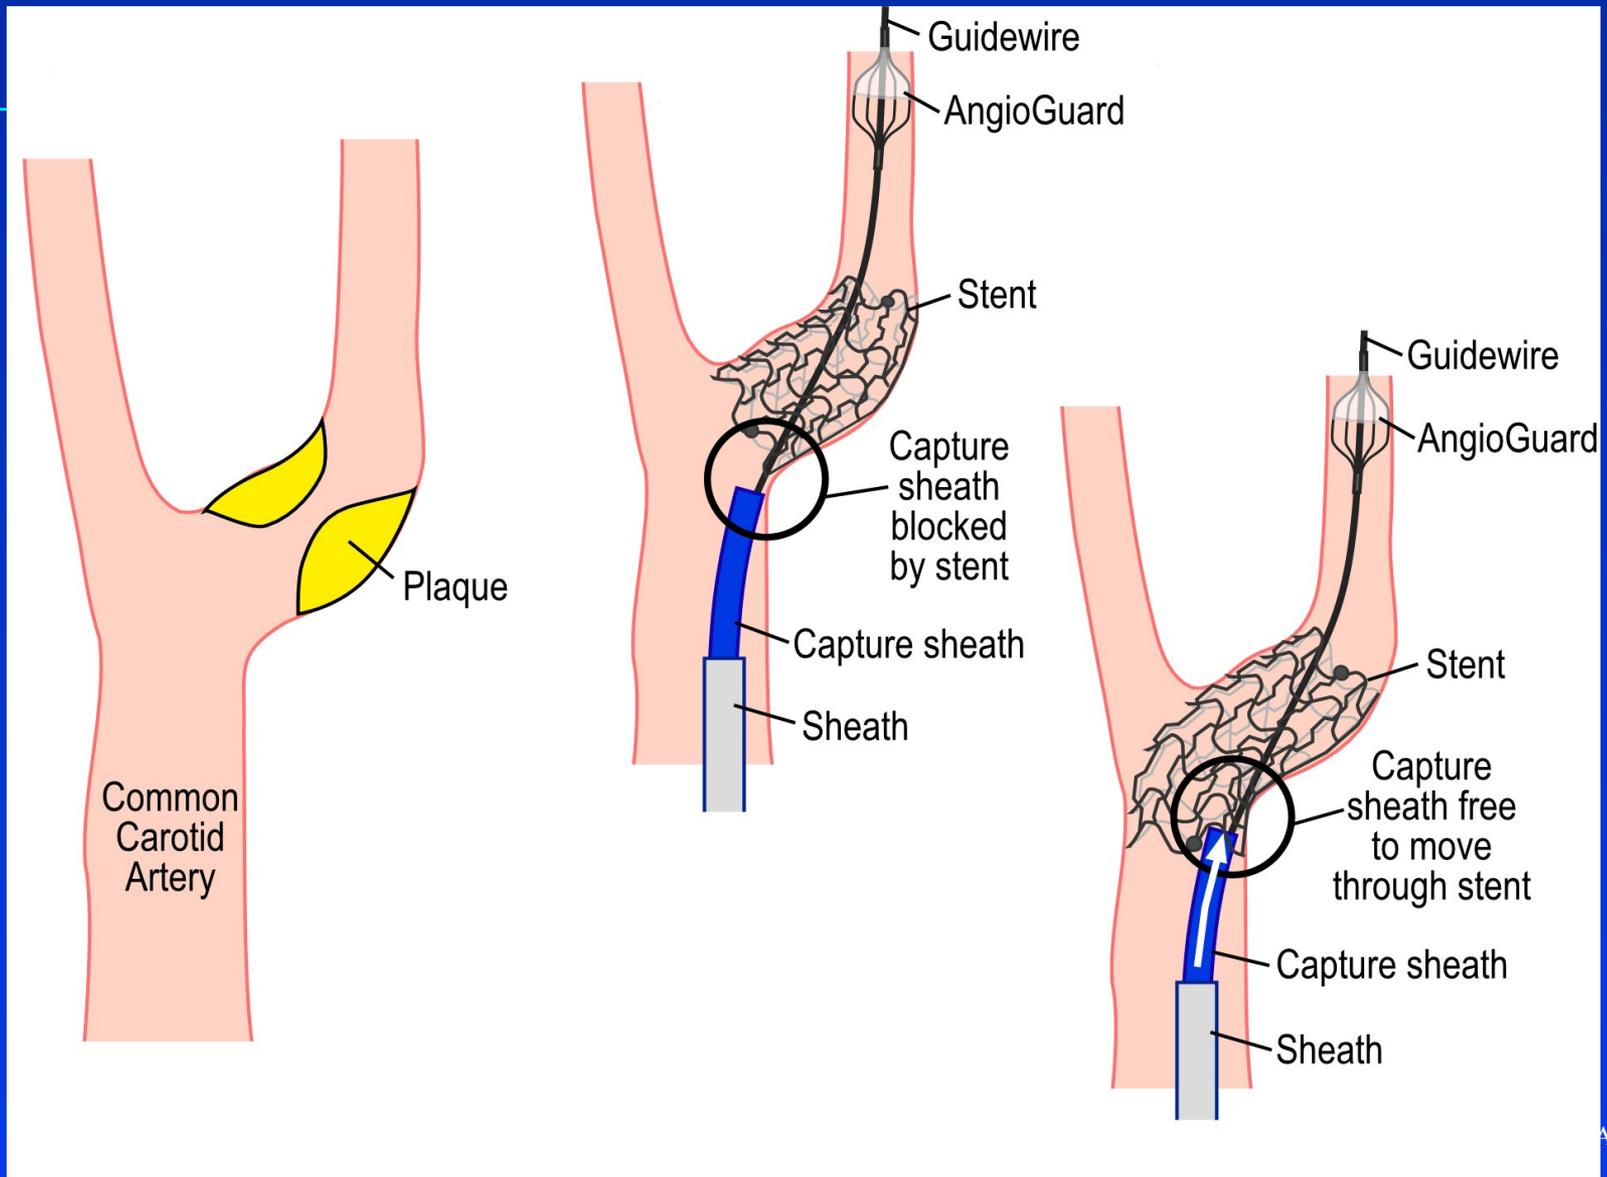

---

- ◆ **Pre-Dilatation:**
  - Monorail Coronary Balloons
- ◆ **Post-Dilatation:**
  - Monorail Peripheral Balloons
  - Viatrac (Guidant), Aviator (Cordis)
- ◆ **Stents**
  - Precise (5.5 Fr or 6 Fr)
  - Wallstent (monorail, 5.5 Fr)
  - Acculink (6 Fr)
  - Exact (6 Fr)

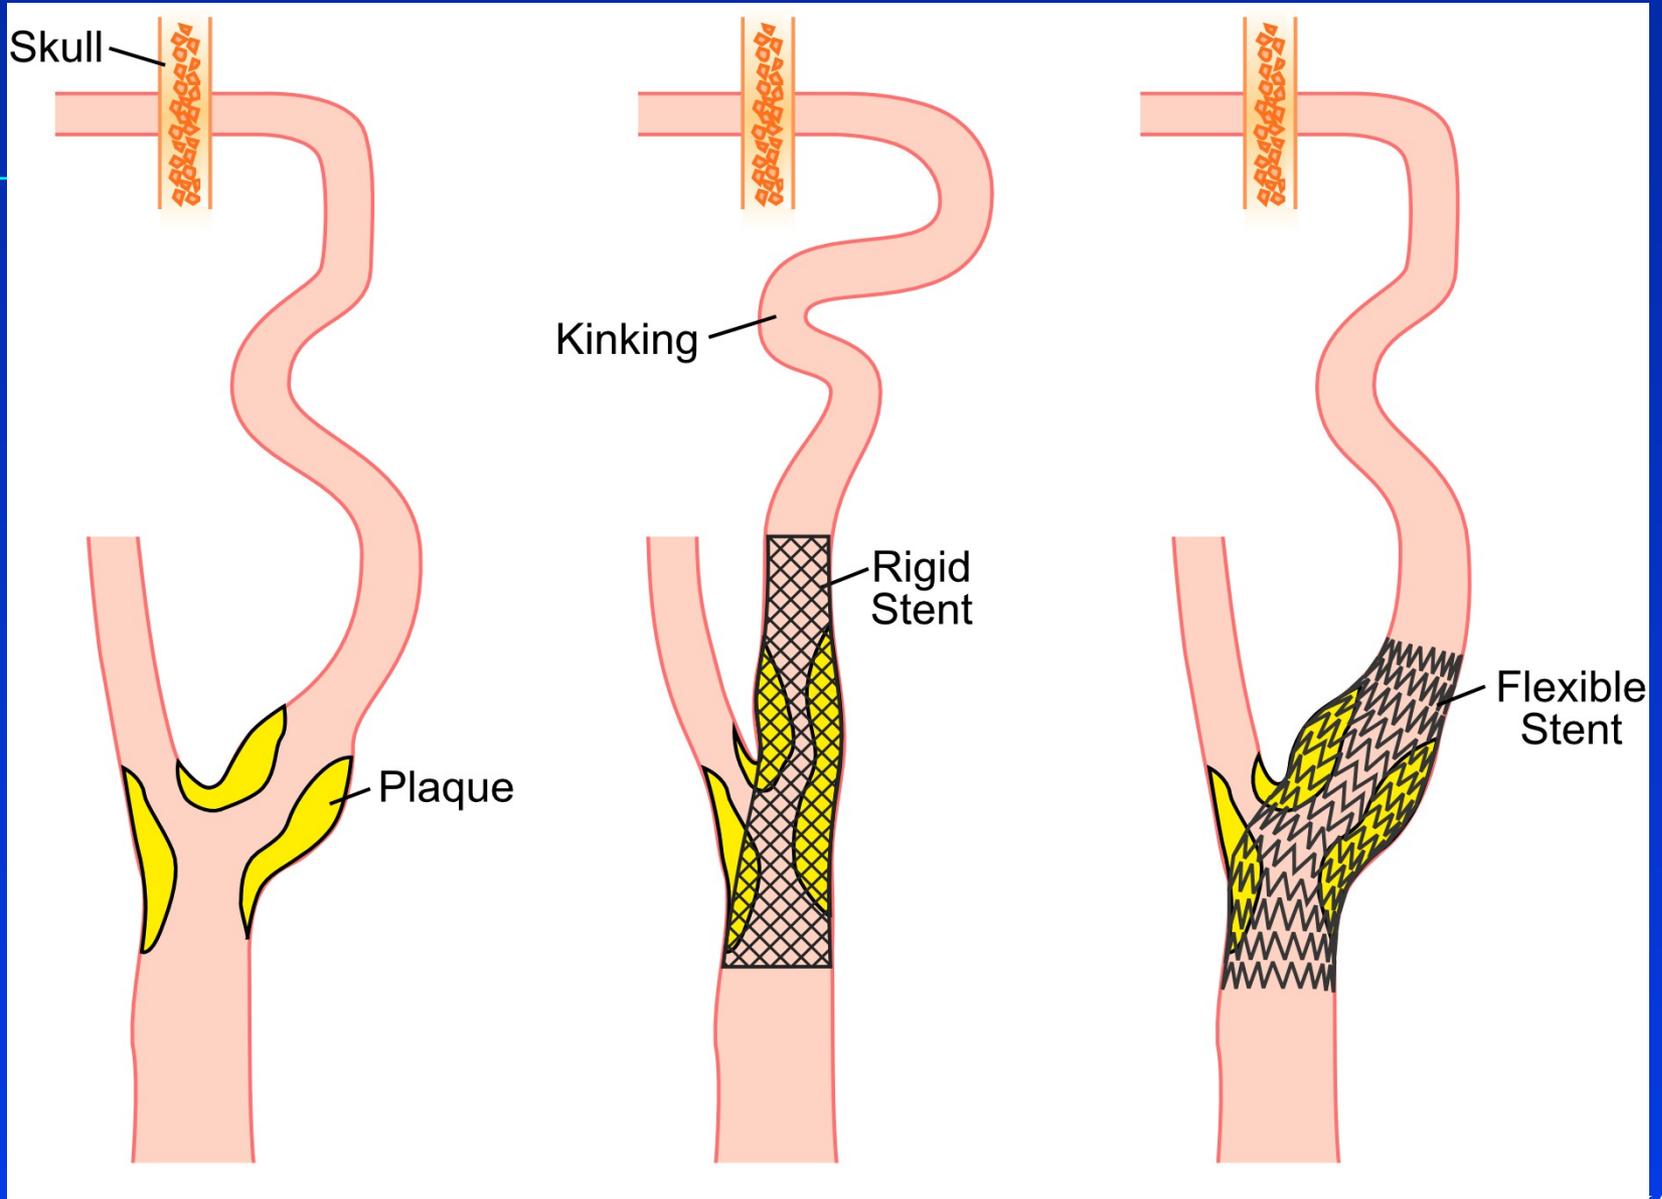

# Proper Sizing and Placement of Nitinol Stents

# Proper Placement of Nitinol Stents in the Bifurcation to Allow Ease of Stent Recrossing

# Effect of Stent Type on Kinking of The ICA

# Post-dilatation

---

- ◆ **Size of balloon – 5.5 or 6 mm**
- ◆ **How much residual stenosis is acceptable?**

# CAROTID SINUS REFLEX

## Special Situations

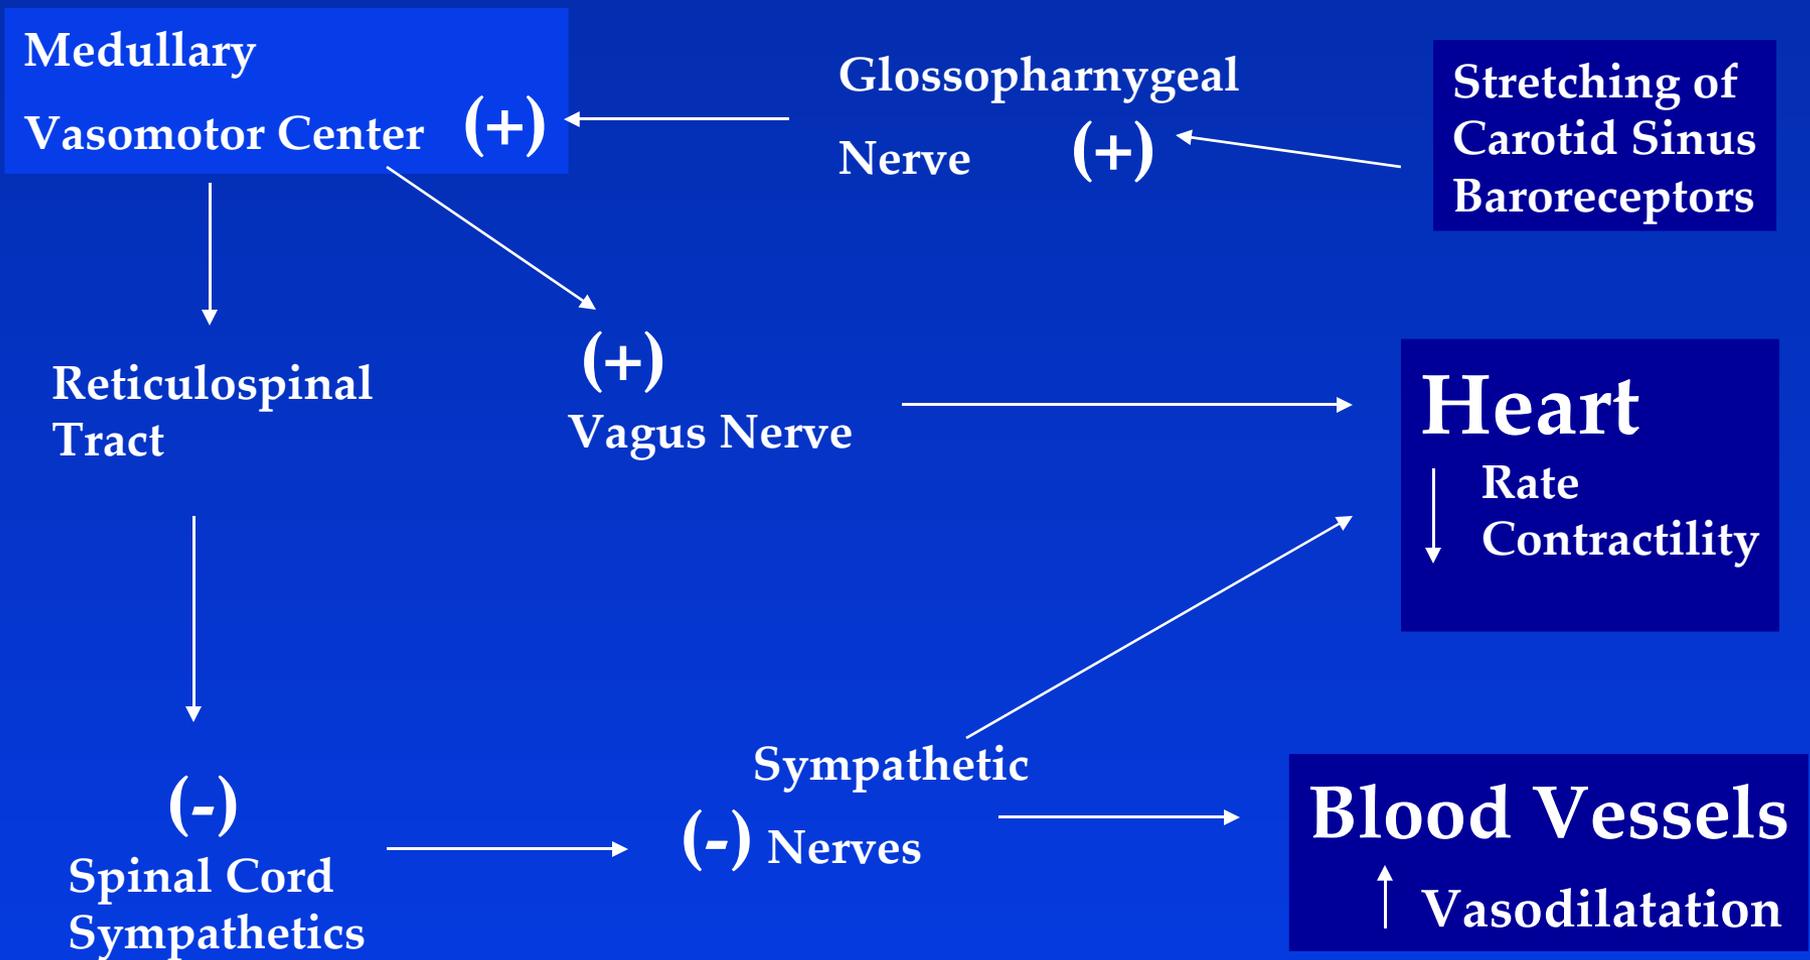

---

- ◆ Critical AS
- ◆ Severe 3 VD or L Main
- ◆ Severe LV Dysfx , i.e. pre-heart tx

- ◆ Pulmonary Artery Catheter
- ◆ Lower threshold for temporary pacer

# Carotid Sinus Reflex

# CAROTID SINUS REFLEX

---

- ◆ ADEQUATE IV (18) ACCESS
- ◆ OPTIMIZE VOLUME STATUS
- ◆ Continuous ECG and BP
- ◆ Atropine, Norepinephrine, pseudoephedrine
- ◆ 6F venous sheath only rarely
- ◆ Temporary pacing is rarely needed

# Conclusions

---

- ◆ **Careful Pre-Procedure Evaluation**
- ◆ **2 days of ASA/Clopidrogel pre and at least 2 weeks post**
- ◆ **Variety of Access Techniques**
- ◆ **Understand various EPDs**
- ◆ **Proper EPD and Stent Placement**
- ◆ **Carotid Sinus Reflex management**
- ◆ **Hyperperfusion Dx and Management**
