

CASE PRESENTATION

Child with Aphasia & Right Hemiplegia

Mouhammad A. Jumaa MD.

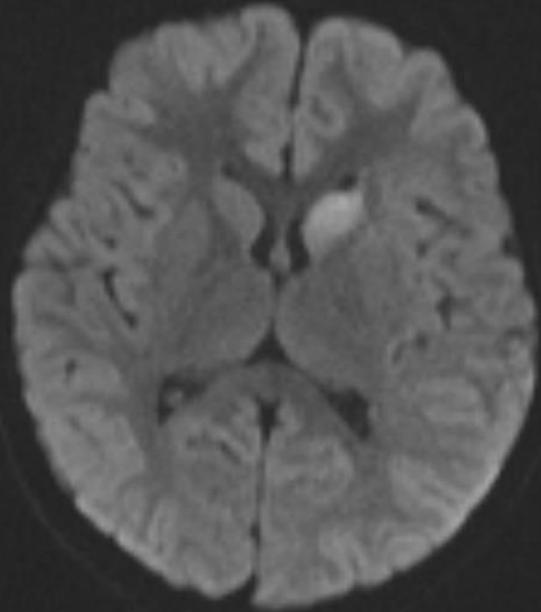

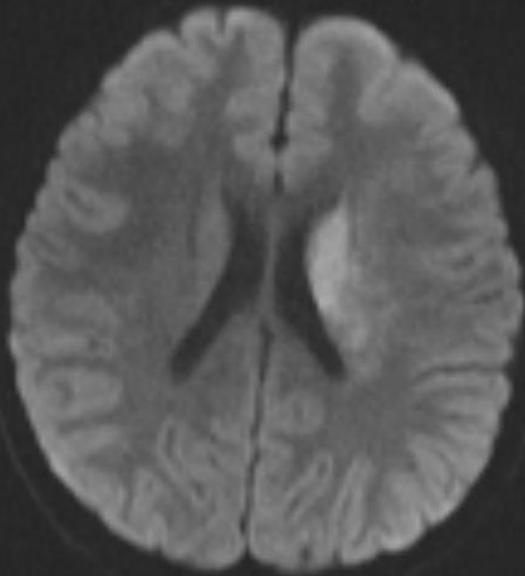

Assistant Professor

Vascular and Interventional Neurology

University of Toledo

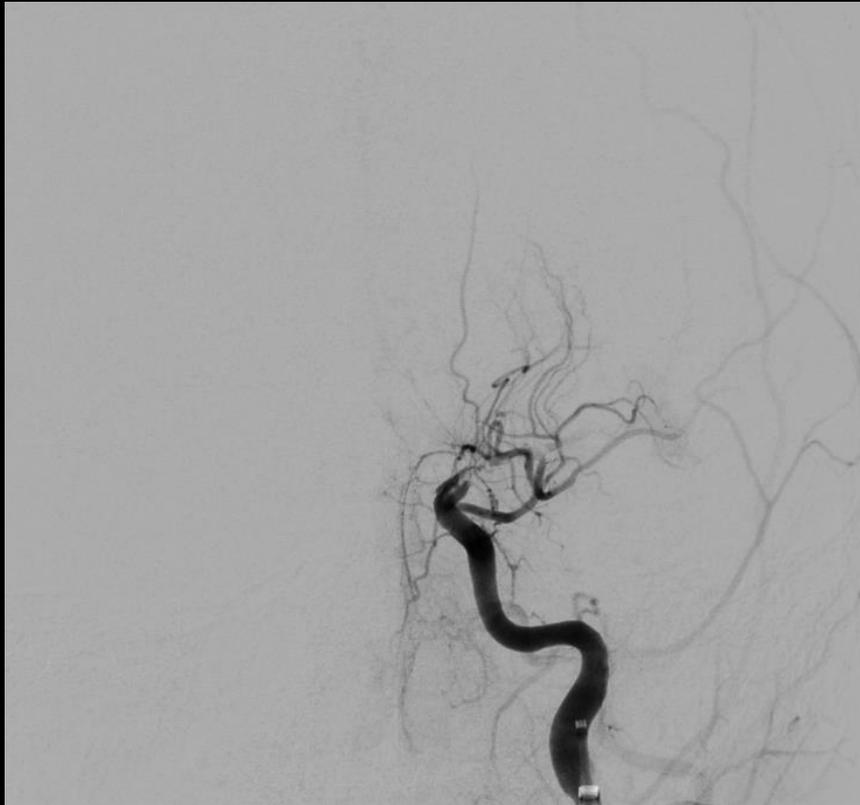

Child with aphasia & right HP

- Otherwise healthy, 6 yom with no significant past history
- He had a fall at school with minor head bruise one week prior to stroke
- He complained of headache for a week
- On day of presentation, he came back from school, appeared somewhat confused; complained of headaches and went to take a nap
- Woke up with aphasia and right hemiplegia
- Brought to our ER 3 hours after he went to sleep and only one hour after he woke up with symptoms

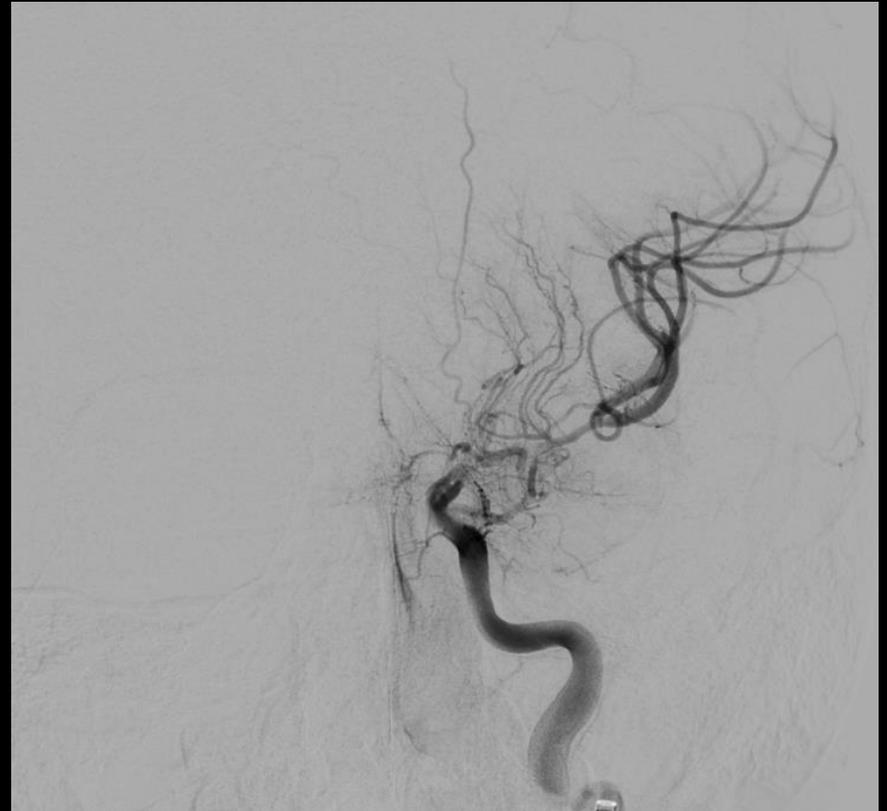

Before Thrombectomy

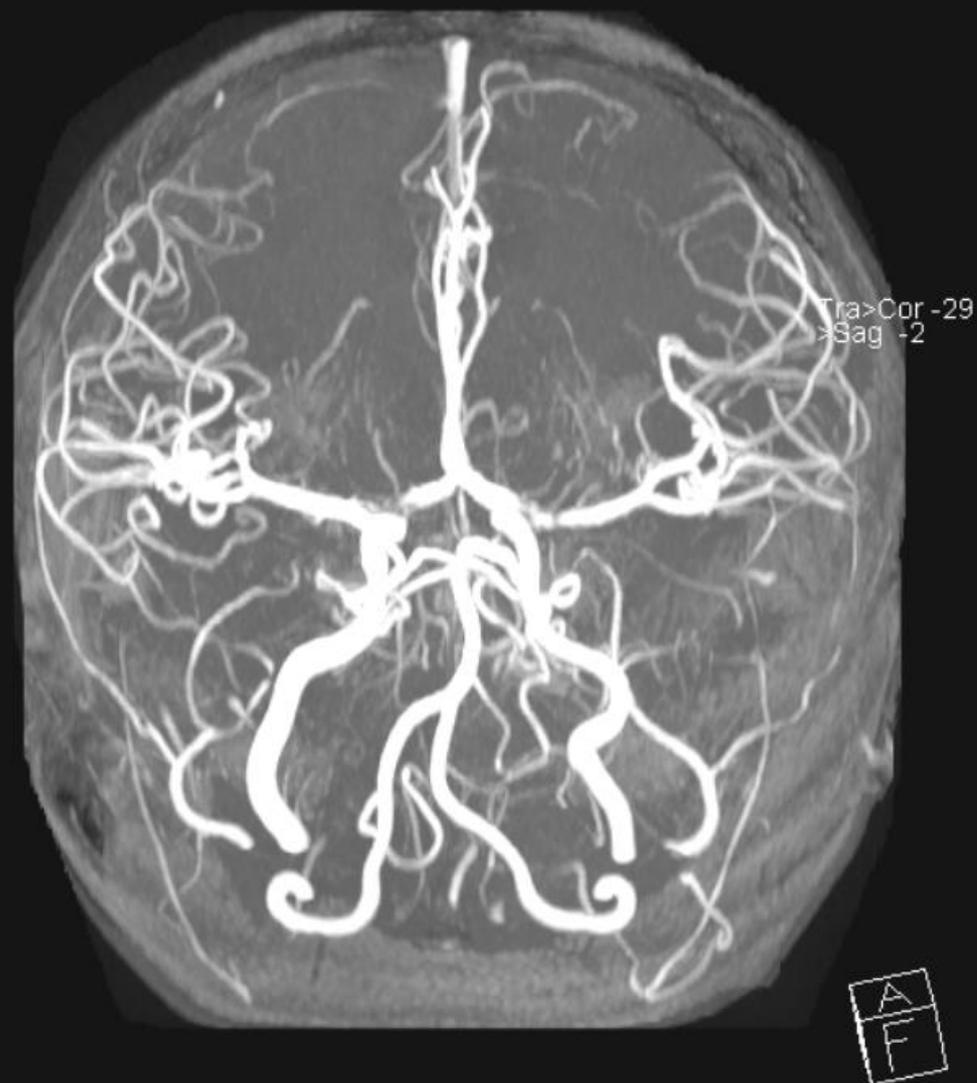

After Thrombectomy

Ophthalmic ICA dissection + occlusion of ICA terminus and MCA. Tx: One pass with 4 MAX over velocity and synchro. Aspiration from distal L MCA and ICA.

Angiographic run from contralateral side, no further passes due to dissection

Follow up MRA next morning
